i'm burning on cheap cdrs and they seem to play great. i'm seeing C1 errors
as maximum 31, average 0.23, total 992 on a single cd with 0 c2 errors.

What does this mean in laymans practical terms please and do i care? I know
taiyo yudens are the bomb cd but what does this error really mean? What
if the cd is going to be commercially duplicated?

Thanks.

It seems you're using a Plextor burner with their Professional
software? As far as I remember, there's standing plenty about these
things in the helpfile. I have 2 Plextor 755A and found out that the
best recording results for audio was with 16X speed on Verbatim cd's.
I also remember Brian T reported 16x was giving best results with his
"newly buied" Plextor CDburner some years ago.

I can send you the Plextor PDF manual if you wish. If so, I need your
e-mail adress. There stands nearly "everything" about these things.

Use GOOD media ONLY (isn't your project worth the extra 50 cents???),
Burn at speeds of 4 or 8 times MAXIMUM, and burn DOA mode ONLY.

David.
