View Forum Message <> Reply to Message

I just installed Paris on XP and if I bott the comp frsh and run Paris I can work on that song with no problems, however when I exit that song the next song loads but won't play. I have to reboot the comp and then Paris to start the next song. Also, if I try to load any previously recorded song that have native plugins running it either locks or will play that song, but won't load another. I am completely stumped, I need help!

Thanks,
Mike

2EDS filling 2 of three PCI's, the other has a second video card.
Amd 2.2 X2 proc, 2gig ram, running XP home.
I cant get to my Paris cfg file at the moment that PC is not online. What should I be looking for there?
I followed the "installing paris on XP" guidelines. I have the pc "optimized" for audio apps.
I can run sessions using eds plugs fine, as soon as I add native plugs it

crashes.

I am using one onboard video card and one PCI, I tried disabling the onboard
but not the PCI, do you think I should try that?
Is that cfg file a general guide or one that works well on XP?

Here is a typical Paris.cfg with more here (www.kfocus.com/paris). My money is on the irq conflicts on the motherboard between video cards and EDS. What motherboard is it and what slots share irqs?

Were you previously running Paris on 98 or ME with no problems? If so, its
probably not an IRQ issue.
Are you sure you followed the XP install exactly. If you get carless installing
the subsystem, bad things can happen. It needs to be installed to the same
location as the Paris exe file.

If I installed it in the wrong location would I still see all the plugins?

were you running win98 or ME just fine with this same config? Also, yes
you'd everythin would work normally up to the crash.

I was running 98se on a different machine and it worked well.
The only changes I made in the config on this machine was to run
256 I/O and 256 cashe
I ran 96/96 on the 98se machine.
All Paris functions are working fine, and I can run native plugins fine,
but when I try to exit that song and open another Paris will not play and
creates an error. Then I have not only reboot Paris, but I have to reboot
the computer too.

C.O.E. is a typical symptom of not installing the subsystem correctly. I'd
try re-installing your subsystem, making sure you direct it to the folder
that contains the Paris exe

Thanks, that will be my next move, I didn't notice if was in the correct folder.
I assumed it would put it there.
I appreciate your help.
