DJ, I had a lightning fast live large band all in one room old school style recording session a few weeks ago.

It came out ok, but too much room bleed in the vocal mics..Any chance Transient Designer could suck it out?

You can't gently gate some of the ambience out?

Neil

Well, not really a bit, but just cutting things out really changes the sound of the whole too much..like turning on and off a room mic in the mix.. My place is really too small to do what we did, but they insisted..and are really happy with what they got, It;s me trying to make the drums sound better really.

Like bad room mics every where! It was a ton of fun though..And what performances! Holly shit..nailed the harmonies live, with perfect rythm sync. I should post a sample. One other problem is that the lead singer/acoustic player was moving too much..ok durning the song..but the acoustic intros are a bit funny..like flanging.just a tad..but hard to EQ as the proximity effect keeps changing.!

On my last live recording I gently (but quickly) ramped down the volume in the vocal mics to between -6 and - 10 depending on if they were lead vocals or backups. That worked in over 90% of the songs, the rest required a little more attention but the principle was the same.

Granted it was a tad labour intensive at times but it was well worth the effort.

Hope that helps

Here's another technique that might seem counter-intuitive, but it can work really well, depending on the source ambience, how much of it there is, how dense it is, etc.

What you do is to gate the "overambient" channels kinda sharply, so that they cut off with almost no reverberant decay, but THEN add an external reverb... longer, but at a much lower level, of course, than the original. Without the external reverb it sounds unnatural, obviously - you can hear the gate & all that, but what you're trying to do is apply the external reverb in a manner so that the louder, but shorter, overambient room blends smoothly into the external reverb... it's easier to do than it sounds, and what you get is usually a nice, smooth "s-shaped" curve to the transition between the too-much 'verb & the trailing end of the lower-level added 'verb.

You can do it with either a send or as inserts, it works either way. Using predelay, you can also massage the "insertion point", or where the natural ambience starts to transition into the

external reverb.

It's a beeeey-yoo-tiful thang... try it!
