I was wondering if anyone might have suggestions as to what the best laptop on the market is today. I have the rare opportunity to get one, with a "sky is the limit" budget. To make a long story short, my wife is going to be laid up for about 6 weeks and requires the use of a laptop to do her work. Once we started talking, we realized that between the both of us, we could put it to good use: her for her business use, and me with remote music possibilities. So we decided to go hog wild and split the cost.

So far, I'm tossing between a HP Pavilion HDX and a Dell XPS M2010. Primarily, we want a 20" laptop with lots of power (both CPU and memory). If Apple made a 20" laptop, I'd be all over it, but what can you do.

Any suggestions?

15" is a nice size. 17" is on the edge of too big (but I'm probably going there due to the HD display).

But a 24" laptop? No kidding? You'd need a really big lap! Or maybe it'd be a laptop built for two. :^)

Cheers,

-Jamie

FYI, with the MacBook Pro 17" you can quickly plug in to a desk top monitor up to 30". If you want a lap top you still want portability, that kind of a combination might work well for you, and you have dual monitors with that set up, not to mention you can run Windows and Mac OS on the MacBook Pro. There are rumors of a 24" MacBook Pro coming, this I've got to see.

I haven't used that particular XPS model but we've had a few of the 13" models out in the field at work. I put XP on them which was a moderate PITA but they're run nicely. See Chris Ludwig's note about FW chipsets if you're thinking of using a FW interface. I don't have any so can't speak to that issue.

Ahha
I know of a lot of people that are running OSX on a Dell, and many other
PC's as well...including yours truly. Typing as we speak on one.

Yeah, Microsoft "borrowed" some graphics from OSX for Vista -- not the
only thing graphically that looks "borrowed".

Dell :

from PC World:

Users have been complaining about electric shocks from some Dell laptops; not to worry, Dell says they're harmless.

Dell has assured users of its laptops that there is no danger from electrical jolts sometimes received from the cases of some of its systems.

Users, including some reviewers, have recently complained of receiving either a continuous electrical "tingling" or sharp shocks from some Dell laptops. The Dell machines involved include the 9400, and more recently, laptops with brushed-aluminium cases, such as the XPS M1330 and XPS M1530.

The reports have caused some alarm, coming after incidents such as batteries overheating and catching on fire. Dell recalled 4.1 million laptop batteries because of such risks in 2006; other major laptop makers, such as Acer, Lenovo and Toshiba, also recalled batteries.

In a knowledge base article published on Wednesday, Dell assured acknowledged that "a tingling sensation may be noticed when connecting devices to Dell notebook computers or printers and touching exposed metal parts of the devices being connected or the parent device", but denied that the "tingling sensation" is cause for alarm.

The jolts reported by some users are due to an electrical potential, or voltage, between exposed metal parts of the laptop and the earth, according to Dell. But this voltage can be found in any electrical device powered by an AC adapter without an earth.

"The voltage does not present any risk of injury to the user," the

company said.

Earlier this year, users began noticing the voltage issue with Dell 9400 laptops. Other Dell users have reported the same issue with notebooks such as the XPS M1530 and other notebooks with aluminium cases.

A voltage test by one user showed that the surface of the XPS M1530 was giving off more than 100 volts of power.

Users have said they could also feel the voltage when connecting cables or accessories.

Dell acknowledged that users might feel a "tingling sensation" but said that the voltage is harmless.

"If conditions are right for the human body to be more conductive, such as having wet hands or standing barefoot on a concrete floor, the probability of sensing the tingling (electric current) increases," Dell said in the knowledge base article. "It is recommended to unplug the AC adapter from the parent device before attaching any cables or accessories, as this reduces the possibility of experiencing the tingling sensation."

Some users who have complained of the tingles or shocks have been supplied with a three-pronged - that is, earthed - power adapter, which solves the problem.

Dell has been shipping two-prong (unearthed) power adapters with the majority of its systems worldwide for more than a year and a half, Dell digital media manager Lionel Menchaca said in a recent forum post. As a result, the company isn't in a position to immediately supply all its customers with earthed adapters.

Dell is considering creating a program to sell earthed power adapters to users at a discounted price, Menchaca said.

Electrical devices can be designed in such a way that they do not need a safety connection to electrical earth, normally by using reinforced insulation or having two layers of insulation.
