---

I'm in the process of building another DAW for some beta testing purposes but now that I've finally achieved what I feel is something that can do 99% of what I want in just about \*any\* possible recording situation (thank you Creamware), I've got a hankering to get back into composing/songwriting and I need a laptop.

I primarily compose on guitar and I used to use a midi based proggie called Jammer for rough compositions. and I have figured out a way to use this with the sound engine of NI Bandstand using Midiox. Christmas before last I bought myself one of those cool little Fretlight strat lookin things meaning to start getting my chops up to speed and getting out of a few ruts I've been floundering around in for years.

I have an RME Multiface sitting here that I could interface with a laptop via PCMCIA. I would like to have a media centric" laptop with a goodly amount of horsepower/RAM/fast HD, that will work well with an RME PCMCIA card for the Multiface This will need to be a windows machine since my apps don't play with Macs..and of course, I want a good deal, whatever that is). I have a Dell Latitude docking station here with an 18g SCSI cheetah that works well with an older Latitude machine (a P2-400mHZ laptop). I'm wondering if another Latitude might be the ticket. Not imperative.....but any experience with these would be of particular interest.

Thanks,

Deej
