flexibility. However, the tradeoff is not really that simple.
 I have found that the performer often "plays" to the compression, especially
during vocals. Think of it in terms of a guitar player playing to the sound
of a sustained amp. You can't really get that after the fact. My epiphany
about this occurred when I put my voice through a Lawson-DW Fearn-Manley
ELOP. For the first time in my recording experience, the damned thing sound
right off the bat like a record. Not necessarily a good record, but a record
nonetheless. :)

to the pan positions when used in anything other than the full right position.
 The mix knob is supposed to be presonus answer to monitoring live inputs
with no latency. When all the way left you are monitoring live inputs, when
all the way right you are monitoring the computer mix. It was counter-intuitive
to use this thing all the way right when not even connected to a computer,
but there you go...

So now I have an incredibly playable, fantastic sounding, great recording
digital piano and it only took me three years of screwing around with shitty
MIDIMAN and ROLAND USB midi controllers, different versions of GIGA and HALION,
different computers, licensing snafus...

So I've been playing this rig for about a week and feeling really good and
my giga box has started spontaneously rebooting from HEAT ISSUES!!!

The end

ChuckSorry about mucking up Deej's thread. I wasn't looking to start the whole

Mac vs. PC debate. I was just thinking out loud.   I go through this same
kind of thing every time I build a new PC or upgrade, it's kind of a PITA.
 I was just wondering if upgrading an Apple Intel mac will have the same
kind of issues? I hope they get it right. I wonder if Apple will have affordable
upgrade paths? Knowing Apple, they will probably solder in the processors
so you have to buy a whole new computer to upgrade.

This machine will be a whole new beast, I for one , will not be the first
to dive in! It will be interesting to see how these systems perform and
what problems they will have with them. People are already talking about
hacking them to run dual boot, with XP and Mac OS. Dual boot would be cool.

I'm thinking, that even though Apple will be using Intel hardware software
locking technology, some body will hack the new Mac OS and run it on a standard
PC with the new chip set. So it might be cheaper to wait.

I guess will know more Jan. 9th. A $299 Mac mini with a built in TV tuner
would be vary cool. A dual boot, multi processor tower with standard PCI
slots that could run Paris XP and Mac OSX would be even cooler!

Anybody have any thoughts?

JamesHi Chuk thanks a bunch for your comments..I too have been finally learning
MIDI,in order to play "soft synths",and drum samples...Very trying at best..
I have been having a huge latency problem from USB/MIDI. interface...Do all
the USB things do this? I am using a shitty old Yamaha keyboard for
controller..I hope I can figure it out...zmcleod

>Hey guys,

Just wanted to let those of you in the DC area know that
Chuck Levins is blowing out Yamaha P-60 digital pianos for
699 after 100 rebate. These are consumer 88 key weighted boards with built
in speakers and sounds and an included ikea type put together stand and seat.

I was headed out to buy a MIDI controller but checked over two dozen boards
and midi controllers and nothing had action that was even close so I bought
it.

I plugged into my giga box via MIDI, silenced the on board sounds and was
up and running within minutes.

Man what a difference having a playable keyboard makes.

So then onto the GIGA. I have the latest GIGAstuduio and was pretty unhappy
with the Gigapiano II with resonance model so I went digging around on the
5 sample CDs that come with it and found a PMI stage piano that sounds really,
incredibly nice.

Then onto the presonus. With the new drivers you don't have to have the
pre-sonus hooked up to your computer at all - you can hook up all your gear
and use it as a mixer. So I hooked in the outoput of my giga box and my
KRK V6s for output. I was seriously disappointed by the sound - it was weird
and phasey and had some kind of psychoacoustic thing going on where the piano
sound appeared to hang all bunched up in mid air somewhere between my eyes.

So I tore the thing apart and re-wired and checked and re-checked and same

thing. Then I found the 'MIX' knob on the pre-sonus does very strange things

---

like a record. That means playing to the sound, of compression, of EQ, of
FX, etc. It's how it was done back when folks made good music, back in the
day....and hey! what do you know? It still works. So far, anyway....

>Of course you were being silly, as was I. Hey, I'd love to have nice dual
G5 as a linux box in my house, no problem. I might like a dual Opteron a
bit more but I'd take either. My point, and I'll keep rambling on about this
as long as I can becuase it's the internet and nobody can stop me, is that
ALL proprietary OS's to me are inferior to the free software alternative
save some critical apps (for me audio stuff) that will never get there. Once
you make the switch, you realize that the label on the front of the thing
is a red herring, a way to bring in revenue for not adding value and convince
people what computer they use makes them a certain kind of person. What a
person DOES with a computer (or a paint brush or a bowie knife or a PEZ dispenser)
defines the person, the rest is just marketing.

And yes, thanks for being silly ;-)

ThanksSome of you guys use a popular distressor (hardware)
what is a comparible software alternative?
ThanksI've got the SPL hardware unit. It's very transparent. I prefer it to any
de-esser plugins I've tried.

All of these plugins are very good, IMHO.

Merry Christmas

;o)

As I mentioned, I was curious to see the evidence you referred to.
Thanks for posting some links.

And yes, you are a platform hater but I understand. :^)

Looking at the links, Tiger 10.4.1 on a G5 dual 2.5 or 2.7 is shown to be OK for workstation apps when altivec is used. Holds its own (their example, LightWave - more examples would be appreciated but that's not their focus). I use LW so it's pertinent to me.

They give thumbs down on server apps using open source software (apparently not optimized for OSX?), and point out that specific choices in the kernel are shown to be slower than Linux. It would be interesting to see if the several OSX updates since then have done anything to address that. For my use as a workstation, their limited examples make it look like OSX on G5 is not a bad choice when software is optimized for altivec. Actually it looked pretty good. And we're not talking quad mac here which conceivably would be some amount better yet.

OTOH, the Opteron looked pretty good, too. It will be very interesting to look at the upcoming Intel dual Yonah processor with OSX, in (rumored) another couple of weeks, and see how that combination does. This is all a moving target.

In the other link, the main bias is the same as yours: OSX is not open source from top to bottom. True. Beyond that complaint, with his specific statistical software he finds better performance under Linux when testing on a couple of older G5 boxes. Not sure if this says much about the music/graphics/video/animation apps that I use (other than his complaint about accessing his PVR files, in which case maybe he should consider the ElGato digital video boxes which work fine - although they
 may not have been out when he wrote his review - the HD one rocks).
But I can see why he made the choices he did for his application.

It's good to have choices. Go Linux! Some of the software I use for browsing, email, word processing, spreadsheet and software development also run on Linux and I like that. BTW, I'm happy to see Linux animation, audio, video, and graphics software moving ahead, step by step. If you're involved in any of that, kudos to you!

For now, OSX and the available software for OSX offers a very capable platform for the media production I do, and the dual 2.5GHZ box I use is, for the most part, amazing. The kernel may have drawbacks for server use, but it has some very nice features that support audio, video and graphics system-wide.

It's not perfect, mind you. That's still out there waiting to happen.

Cheers,
 -Jamie
