Heads up boys and girls; ye olde Pacific Plate is rustling around in the last two weeks in places it doesn't usually. Started southern-most opposite edge of US left coast and is now scooching around on the ocean floor in Alaska which is the opposite end that plate. My completely non-scientific opinion is that it may release in the middle somewhere (further south along WA, OR, CA) in mag 6 kinda way. Been watching this pattern for, oh, 3 years. So, tie back your racks and put your \$2000 and up guitars in their cases.... or not.

Well, I noiced a few cubic meters of La Jolla slid down the hill today... that road is on a fault line - think this has anything to do with that?

Nah, the immediate southern CA coast line is always donating. I'm tasking about busted pickle jars and swaggering telephone poles.
