I've got 4 in a magma with no issues on WinXP. I seem to remember someone having some issue with the avid box/drivers though.

Also for me, I've been running 442,442,none,mec from first card to last. What is plugged in where has made a difference for many in the past. I started this way and never had to change.

Hey guys, as pricing for EDS cards have dropped, I've purchased a couple more to add to my 3 card system. Typically, I keep one as a back up, but I wanted to know if there were any problems adding a fourth and possibly the fifth to my 8 channel Avid extender.

I spoke with Gene and recall him mentioning that there might be a problem going beyond 3 cards (Gene, was that within the PC?).

Before purchasing the extender, my Win98 PC worked with the 3 cards installed and I put in the fourth to test and it worked, though I only tested it for a short period.

I recall reading posts of larger systems, but can't recall the details.

Thanks,

Tyrone

Eight. There were several systems this size a few years ago. The

only issue is IRQ conficts, but once those are ironed out, it works just fine. We had 7 cards running here at one point, but I retired 2 as spares. Currently we have 5 cards in the magma chassis.

David.

BT had 8 cards in his 13 slot Magma when I shot the vid. Dunno if that helps you or not, but that is the max amount of EDS cards in any one rig. AA

Tyrone,

I'm running 4 x EDS cards in a 7 slod Avid branded Magma here. I got it from chris. I think you old me you got yours from Chris too. You should be good to go.

Deej
