Hi everyone,

I dug my Paris Mec system out of mothballs and beefed it up with another
DSP card and some more inputs. I bought a Power Mac Mirrored Door G4/1.25
GHz Dual Processor, Dual Bootable and put 2 gigs of Ram in it, I thought
it would handle Paris no problem, such is not the case.

I have tons of work in on these projects and then I get this error code;
_tpt Que Project, error in queing the project and error in setting direction?

One of the codes I get is Error code 1879048261/70000045.

Anyone know what that is?

And would anyone happen to know the best configuration for the Paris Memoery,
the Disk Cache, Overview Cache etc?

Any help would be greatly appreciated.

Thanks Michael

Your machine should be no problem. I'm not an expert on
Configging, but I have 250 MB as minimum allocated memory.
I clear the undo cache a fair bit while working on a project.
IIRC this is more of an issue with Macs.

Inside Paris config I have
Disk I/O at 96
Disk Cache at 100 MB
Overview Cache at 3.5MB
