Also some may think that certain DX or VST reverbs sound equal or even better

So,  
We put EDSTransfer=8,16 on top of Paris.cfg  
We use Spinaudiolite FREE (see previous psot for link) to wrap senderella.  
We put senderella configured as send (default anyway) we put around 50% of volume (that is to prevent buffer clipping inside senderella) and we REDIRECT the sound on bottom of senderella.  
We put senderella as a send on each of the tracks we want to use reverb.  
Say we have a lead vocal and background voices plus a solo gtr.  
So on all that tracks we put senderella as above.  
NOW

On tracks 15 and 16 you load your EMPTY 16 bit paf file of a length equal or bigger than your actual song.

On first Native slot you put FFX-4 (free too) as a stereo instance on track 15

There inside it you open senderella configured now as a return again with around 50% (as a start) volume.

NOW you open inside FFX-4 on second slot a stereo reverb like Waves trueverb (if you have it) or DSPFX Studioverb or the FREE and nice sounding Galceverb!, FreeverbToo, Classicverb and others ( I will gladly email all free and nice reverbs if asked to)

NOW you should be hearing your reverb return on tracks 15 and 16 and you can check the NO LATENVY with just having a dry signal on reverb's return and flip the polarity.

So we man

ella2 it goes to the right.

Balancing the volume sends you can localize the signal to the reverb send stereo image.

I hope all the above make sende.

Regards,  
Dimitrios

You are correct Miguel. Tony said that they were manufactured that way as  
to provide lower pricing. He did share with me that thye did use authentic

Telefunken tubes. If I recall correctly, the primary difference was that the housing was made in China.

Oh yeah. And I generally hate pedals.

We always wrestle with compressors for guitar live. It's hard to get  
the compression we want without the life all going out of the music.

I have a pair of DBX 160 VU's that come close to the sound I

want if I keep the ratio really low. Close, but not perfect.

What I have always wanted to hear is the trick we do in the studio where we mult the return (on tape) or copy the track (in a DAW) and squeeze one track and don't squeeze the other. Play with the relative levels a bit, and maybe some EQ and you can get some sterling tones. (btw, this is not panned left and right, this is a mono effect I am speaking of) I used to use my Carl Martin compressor this way by using the 4 inputs on a Matchless DC-30. Run the guitar into the high gain input, then run a shorty from the low-gain input on the same channel to the compressor, then run the comp out to the other channel in. This got the signal to both channels, one side compressed and one not compressed. I got some great tones, but it was pretty cumbersome to setup and adjusting the volume got pretty involved...

The Barber Tone Press, does it all in one box. You get volume, blend, and compression. What I do is run the blend up to full compressor and then adjust the compressor knob until I am hearing quite a bit of squeeze going on, and then pull the blend back until I get just the right amount of uncompressed tone going through.

Sounds flippin' amazing. I generally leave it on all the time.

BTW, this thing really helps heavy music, it's are not just for country like a lot of people think compressors are for live. With the Tone Press you can make even metal sounds much more massive and studly.

Works equally well on all my guitars and all my amps. Even the Hiwatt, and that thing hates pedals.

Oh, and it's 139.00... Get one. You won't believe it.

A fantastic list of stores which are going straight in my favourites for future reference, however I still can't find what I'm looking for.

I'm wondering if I should look into the option of removing the latching mechanism from the latching switches to make my own non latching variety...

Cheers,

Kim.this may sound completely ridiculous, but have you contacted Peavey online?

I've had several of their old 70's amps that may have the big chrome switch

I think you are looking for dude.

Ampeg would be another viable source for this. Ask for replacement parts.

Ampeg is owned by St Louis Music now, fyi.

I have carpet on the floor and bare walls. My room is 30x35 with 20ft cathedral ceiling so it's a large enough space to get rid of a lot of early reflection problems. Below are tips I got from the awesom Dave

Moulton. Enjoy

## Making Your Home Control Room The Best That It Can Be: Some Basic Principles

by Dave Moulton

Most of the articles we read on control room and studio acoustic design seem to center around materials we might use to treat wall surfaces, and some tips about using those materials for fun and profit. In this

that these are actually pretty straightforward, and you can apply them

better what sort of problem you have, and how to cope with it more effectively.

I first came up with this list of principles while preparing for

want to get out of our control rooms, even though that is what is really important. For those of you who are interested, the whole presentation is available on my website at

<http://moultonlabs.com/slides/smallrooms/index.htm>

construction of ANY control room, including your bedroom, basement, minivan or closet. If you systematically work through these, and do your best to optimize your particular setup with the resources you have at hand, you can actually get surprising decent monitoring quality,

The seven issues you need to deal with are: noise floor, room symmetry, early reflections, decay time in the room, standing waves, loudspeaker

briefly.

### Noise Floor

Noise floor can be defined here as the level of noise in the control

music is playing, all the equipment and air conditioning is turned on, etc. This is a pretty important issue, because it pretty much defines the audible dynamic range of music that you can hear in your particular

as possible, so you can hear as wide a dynamic range as possible. Right? There are two parts to dealing with reducing such a noise floor.

Room isolation (shutting out the noise) can be difficult and expensive.

However, in your bedroom control room, you can usually make big

all of the doors and windows, as it is through these passages that the

and see how far you can get.

A big problem here has to do with air conditioners. Aside from the

also allow sound to fairly freely pass through them, severely compromising isolation. Solutions to this vary widely,

outdoors in a separate unit and puts a separate heat exchanger on the inside wall), the construction of baffles around the air conditioning unit to reduce the noise of both the unit and from outside, and installing central AC with oversize ducts and baffles, etc.

You are gonna have to suss out what works for you in your particular case. Just keep in mind that it can be really hard to get it really quiet while keeping it really cool for really cheap! Also, keep in mind that the very simple option of going without AC is usually a pretty unpleasant way to go. You can try it, of course, but be prepared to change your mind after your first 12-hour session.

Meanwhile, machine noise is insidious. Manufacturers are generally indifferent to the noise their equipment makes. The only solutions

noise). Iso boxes can be homemade, and you can get away with cheesy and

some provision for cooling air flow. Remote machine rooms seem very elegant (and at their best, they really are), but they can bring on infuriating computer problems (when you have to trundle from keyboard/monitor to CPU, 20 feet back and forth and down on your knees in the back of the closet, ten times in quick succession!). In the case

with a handy remote control I got.

dB below the noise floor, that 40 dBA noise floor gives you a signal-to-noise ratio of something like 60 dB from the standard calibrated mix level used by the film industry (85 dBC from one speaker, as heard at the mix position). This spec will also yield an overall

you get there!

Symmetry

Room symmetry is hardly ever mentioned, yet it turns out to be critically important for the reliable monitoring of stereo images.

it is usually the single most effective thing you can do to make your control room start sounding really good and turning out decent mixes.

sides of the control room are identical in shape and materials, that

Needless to say, the loudspeakers need to also use this median plane (see below).

Unfortunately, such symmetry by necessity includes furnishings, windows, etc. The good news is that most rooms are rectangular and rectangular rooms start out life being symmetrical by definition, at least until you start adding doors, windows, closets and fireplaces. I generally recommend that you set up the median plane along the long axis of a

it can be a pain to deal with doors and windows, but you can usually obtain decent symmetry with a little effort in any rectangular room. Again, the solutions here are common-sense ones, and you simply are going to have to both figure out and then negotiate how to get your

Early Reflec
