Hi guys

Have an interesting scenario that might just be coincidental but then again maybe not.

On two sessions where I have had to transfer audio files via USB stick from an Apple Laptop to our main DAW (PC), about 30 minutes after the transfer the DAW starts choking then hanging and / or blue screening and the last time it just shut down with no warning.

If it happens again this morning I'm going to write down the blue screen info and pass it along but for now I see no common factor except the transfer from the Apple to the DAW

Thoughts

edit to add - went in this morning and pushed the session to its limits and no screw ups at all...go figure
