I have been asked to restore some songs that were tracked to analog tape back in the 70's and then digitized to CD. When I heard them I said WOW!!!.....how am I going to get that wow out of the signal? It's wow'in bigtime. Is there a wowerizer plugin or .....what? Maybe automate an EQ to slap a curve on the stuff that is goin' away to match the frequency curve of the stuff that is coming back? If there is a wowerizer plugin, I need it.

When we transfered my Grandfathers 78's to CD we had the same problem... my uncle took the Dat's to a friend of his who apparently used a midi tempo map and either sonar or Cubase to do this...as to how they actually did it I'd have to track down the engineer and ask him.

DOn

I've located a company that specializes in this named Plangent. Sounds like it may be \*doable\* but it's best to have the original tape.
