---

Just ran into the weirdest problem with using the record enable button on the C16.

I have a 5 card, 3 C16 rig and running 3.0. I realized recently that I can only enable record from the 2 C16s that are plugged into the first two EDS cards. The third C16, plugged into any of the other EDS cards, works completely normally (as far as I can tell) except that the record enable button will not arm a track. The lights correctly show when a track is armed for recording, it's just the button that doesn't work.

Fast forward through several hours of swapping C16s, CAT5 cables, EDS cards, EDS card positions, jumper cables on EDS - nothing fixes it. Finally I load PARIS 2.2 and it everything works as it should.

Is there some issue 3.0 and multiple C16s?
