To James & all you mac guys,

I bought a Mirror Door Drive G4 mac (single processor) on Ebay about a year ago, with the idea of making it my Paris machine, but I thought I would test it first without Paris. At first it seemed to work fine, but it soon started freezing up, usually after a few hours of use. I opened the case and put a 12" fan pointed directly at the processor, and it worked perfectly for awhile, but after a few months it was back to the old tricks. Definitely heat related, as it's worse on hot days or if I keep my computer closet closed with the light on.

Any ideas on what I might try?

Thanks,
Dale
