put Paris in debug mode on initialization? Seems like it was a 2 or 3 key
hold down while starting the EXE file.....
I'm doing some testing on my system and I'd like to debug.

AA

Got It!

- Right click on PARIS app icon to get menu,
- Click with left button on open, but don't let go,
- Hold down control and alt,
- Let go (launch),
- When you see the window at the bottom of the screen you can let go of alt/control.

After you produce the problem quit PARIS. You will see a file named
"AppMessages.txt" in the PARIS application folder.

Thanks go out to John B's webpage for logging this info.

I'd personally LOVE to have a published record of every error code and what it really means. Too bad ID never saw fit to do that for the users.

Now Kimmers, once John B gets rid of his last piece of Paris gear, you're going to have to cache his Paris notes somewhere on your server!

:D

Hmm, good point...

I'd better check he's not getting rid of it... if he is I'll happily host it here.

Cheers,
Kim.

Per www.kfocus.com/paris under troubleshooting

How to report errors to ID:

=====

1) Generate application messages with this occurring and send me the app messages file? The procedure for this is below:

Win9x:

- Right click on PARIS app icon to get menu,
- Click with left button on open, but don't let go,
- Hold down control and alt,
- Let go (launch),
- When you see the window at the bottom of the screen you can let go of alt/control.

After you produce the problem quit PARIS. You will see a file named "AppMessages.txt" in the PARIS application folder.

- Send support@intdevices.com the AppMessages.txt file content with DETAILED description of system and problem.

=====

one step further, if youve got a client in a few hours, then you might find it useful to at least have a bare bones paris running. think of it as "safe mode" - you should

1. deactivate the VST plugins (just drag the content of your VST plugin folder into a subfolder called "were closed today" or something ;)

2. deactivate the direct x plugins. in the paris.cfg file, theres a line saying:

```
DisableDirectX=0
```

change that to 1. or vice versa, if its 1, change it to 0, not sure which one was which.

3. fwiw, just in case, you can even disable the paris fx, which

should disable the EDS daughterboard. thats just a guess but still worth trying IMHO. heres a quote from an edmund post how to do it (i hope quoting edmund when its about stuff like that is ok :):

Put the following line:

TestFXEnabled=0

I asked Edmund, I think a couple of times, for just this.

He kept those things very private. I remember running into one of his little debugging messages..."Warning, Will Robinson!" He wouldn't say anything about it other than it was just a debugging thing.

I'm not sure what's up. In Safari there are no frames, I may have them turned off somehow. I can right click and open them Tabbed or in a new window. I cant down load the tree pad file. With Mozilla/ Firefox the the frames show but when I try to down load the Tree Pad file it says the file is missing.

I think it's a bad link to the Tree Pad file???

paris notes is a usefull link, especially for paris beguiners (like me). in fact, i browse few times a week.
just be carefull with treepad freeware : after installed the freeware, my antivirus (kapersky) removed it as a trojan.
