s anyone have any schematics , because to take it to my technician there
isn't much he can do without schematics.

Regards,

Dimitriosmaybe she should really try sneaking in to see GL. you on the other
hand buy 2 tickets just in case and listen to a police scanner.

I would appreciatte anyone sharing a schematics to have it fixed here.

Thanks

If it's one of the EDS chips that have blown, which is possible- they get really hot, it can't be fixed. At 250 to buy one from East Coast Music Mall, I think a new one is probably the way to go.

But, I'd see if The or Emu would share the schematics with you.

Good luck!

Would be nice to solve one of these things every now and then without spending more money -- but I'm already leaning toward upgrading that card to the newer "DSP" version, with onboard midi i/o. And I have an older machine that my original 9652 would do well in. Then there's new samplers to look at, etc., etc.,

"Why do these kids need to eat again? -- Didn't we feed them last week?"

Yup - I'm placing them in the library. They show in other projects =
once saved,
until I reboot... then they disappear. I may try reinstalling the FX =
subsystem.

In the meantime, suggestions welcome!

Thanks,=20

almost gave up guitar for synth back in the 70's. The first night I had a Minimoog I played with it till the sun came up.

He's in heaven putting a ring modulator in God's synth rig...

oooHHWEEEEEEE Skronkskronk

DC" but the ram passes the 4 hours of testing I gave it."

kim, that means nothing in the land of puters. 2 years i went though that with my mac where all tests (took it in at least 10 12 times and each time everything was fine...bullshit. them recommended ram was not compatible with it. even though it posted as fine there was no difference in performance with 1 or all 4 sticks installed. after swapping out the ram it finally worked. (i also had the mobo cpu and boot drive exchanged twice.) the ram by the way works fine in other machines.

cely in this machine. I don't
know if it will work with Win ME.

The DSP/FX card is a one trick pony in that only one of the many FX can be
used at the same time. I primarily use this DSP/FX card if I need a pitch
shifter/harmonizer/chorus. It has some nice ones. It also has a pretty
aggressive bus limiter and the EQ is decent too.

The only reverb implemented for this card is the *Acoustiverb*. The
Studioverb (which sounds reminiscent of a Lexicon and is bundled with their
DX version) sounds a bit more dense. I like the Acoustiverb OK. though it's
a bit *tinny* to my ears. There's definitely a place for this as opposed to
the thick/ muddy texture of a Lexicon reverb. This card is discreet stereo
so that gives it an advantage over older Lexicon units that are mono
in/stereo out if you're needing discreet stereo.

If I was needing a reverb, didn't need *true* stereo and was going to choose
between this old DSP/FX card and an Alesis Wedge (another *dead* reverb
device I have here that can be purchased for around \$100.00 US on EBay) I'll
reach for the Wedge just about every time. The Wedge is maybe the biggest
bargain there is as far as lush sounding reverbs are concerned, IMHO, though
it's mono in/stereo out.

I think DSP/FX still sells these, though last time I looked they were still asking \$300.00 US for one. For \$300.00 US, you can get a lot more bang-for-the buck these days. If you're looking for a *high end* hardware bargain, I'd spend a little more and find a Sony V77. It's a great piece of work, though, make sure it's got the pigtail for the digital I/O. They don't make them any more and they are *really* hard to find on the after market AFAIK.
