For what it's worth I looked into the compatibility issues of current chipsets which used bridged PCI vs slightly older systems that have genuine "native" PCI.

As a result I went for a Gigabyte P55-UD3 which has 3 native PCI slots as well as support.

You can put an intel i7 870 or 860 on that board, and the have a very upto date fast system, with the best of both worlds; you have floppy and IDE support but also SATA and even USB3 if you get the UD3R.

However Mike's use of the Virtua via proves that even "bridged" PCI will work with Paris - I just decided to play it safe at the time I was putting my system together.

Anyway, I hope the above may be useful to you. I bought my board and processor 2nd hand on ebay BTW
