Hello Guys,

I did not see anywhere for my answer but then again I'm not that good at using this form either.

What I was hoping to do with Paris is send my recorded channels back to the MEC output cards, then mix through my main mixer to sum and mix the music.

Can someone explain how to do this the proper way?

I know you can use them for effect sends and returns but I have not had any luck doing that either.

So I have 4 loaded MEC's with cards, they all have the cards and 16 channels of input and output cards installed. I have 24 tracks of A-Dat I/O as well.

Thanks,

Jeff

Hi Jeff,

This should be possible. Try patching in the "external" effect in the eds inserts at the top of each channel. If I remember right, each insert has to have an output and an input. Of course, you don't care about the inputs - just choose anything. Check in the patch bay for the "Mixer-A inserts" and patch in your I/O modules.

I hope this helps.

Mike
