When I load a project that was originally started on a different Paris system, it seems to get this pulsating feedback loop going on whichever effect is on Aux 1. I have tried removing the effect and it stops, but even if I assign the same effect to another aux (like aux 3 for instance) it still does it. So it seems to be corrupting the effect. Doesn't matter which effect it is.

How can I fix this?

My system is currently a P4 MSI motherboard with 512mb RAM. 2.9 ghz. Paris runs really well on this system. I am also using XP pro. The C: drive is a serial drive but I track to an IDE drive and an external USB drive. Both of which work great.

Spappy,

Don't know if this applies, but I had a similar effect pulling up projects that hadn't been saved since I added a word clock. If this could apply, double check your clock and sample rate settings.

Hope this helps,

Jeff

It was a really wierd problem. But I replaced EDS card and problem went away. Still trying to figure out what the deal is on that.

It could be that your daughtercard has gone south.

I had a card with a bad daughtercard, and it would make weird noises when trying to use the effects.

If it passes audio otherwise, I would guess that to be the problem.

Cheers,

TC

Pull the daughterboard off and clean the contacts with a nice de-oxid type cleaner.
