Hey guys, I have a problem I can't seem to get to the bottom of. I have a mix I'm very happy with - all the levels are good, the effects work, and I like the sound. When I'm listening to it in PARIS, everything sounds great.

The problem is when I bounce it to disk. When I listen to the L/R PAFs (or WAVs, FLACs, or MP3s), suddenly one of the parts of the song - a big chorus-sounding comp I put together and inserted into the track - gets what I can only describe as "fluttery". I can't tell if it's pumping from the compressors, a phase issue, or what.

Why can't I hear it in PARIS? Why does it only show up in the bounce? And more importantly, how do I fix it??

If you'd like to hear it, I've put the project files (the ppj with audio) and the bounce up:

This is due to the mastering engineer ASAP, and I can't get a clean mix out. Any insight you guys can provide would be amazing. Thanks in advance.
