[View Forum Message](#) <> [Reply to Message](#)

Hi group,

Per this groups opinions and experience, I couldn't decide on a clock or a DAC so I ordered them both. It stings \$\$\$\$ but I should be a happy camper come the weekend.

The Big Ben with a 3' quality cable is on the way and I don't know whether the MEC is un-terminated or terminated. I have the MEC booklet but it doesn't state it. For the time being the I just need one word clock out of the Big Ben to the MEC. If un-terminated, then the Big Ben user's manual says I need to connect a BNC "T" with a 75 ohm termination. If the MEC is correctly terminated, then I can just connect the clock in and fire it up. For now the MEC is the last and only interface in the clock chain and per the BB manual it states that the last item needs to be terminated.

What do you guys and gals know about this? Do I need the "T" and 75 ohm terminator or is the MEC correctly terminated?

Thanks,
Wayne

I used a terminator cap on my MEC outputs and they were happier for it. I don't know about the

BB. You do not want to "chain" your devices if you can help it. Run a separate BNC cable to each device you want to clock. Make the cables of equal length if possible.

Thanks DJ. I agree not to chain and I don't need to at the moment.
Anyone else wanna chime?

I'm completely terminated on all ends.

Yes, make sure you use true 75-ohm BNC cables, there are also
50-ohm cables out there with BNC connectors out there, and
those will f*ck up your world from a clocking standpoint.

Cables coded RG-58 are 50-ohm, and RG-59's are 75-ohm.

Thanks guys,

Are you terminated with a BNC "T" on the input of the MEC? see attached, or
is your termination on the MEC clock out because it is electrically the same
point?

Terminate the output of the MEC... just to be sure.

David.

David,

Do you mean terminate both the input with a "T" and the output?

Hi group,

I picked up a 75 ohm termination from Kiesub electronics and I put a meter to it. It only reads 1 ohm. I thought it was a resistor load termination

but is it possible that it is a inductive or capacitive load and therefore can not be accurately testing with an ohm meter?

Just run a straight feed from the BB to the MEC input. You don't need a "T" for the MEC input. Use a 75ohm terminator cap on the MEC out.

No, just the output. I have never been a fan of using T's in word clock or video cabling.

David.

Sorry.....Dave will only be "great" when he gives me his DM 2000.
Until then, he is "very very good"....."pending greatness".....he knows
how to move on to the next level. It's up to him now.

;o)
