Hi Everyone,

I started doodling with Paris again after listening to my buddy's CD that
was created entirely in Paris. Of course it was a relatively fresh install
so there were some issues. Generally speaking I don't think I have the
settings right for my system. It goes between the standard "your system
isn't fast enough" (not exact message) to "is your hard drive winding down"

Besides getting my system up to speed, I'm wondering if I should consider
moving into the 20th century and getting a new platform that is still being
supported.

My needs are simple enough. It is strictly for my own personal use and I
don't need a ton of tracks (32 is fine). I also don't do anything with MIDI
and don't really care to. I would like to be able to use UAD plugins without
latency issues and have a machine that is easy to use.

I've been out of it for years, but I do scan the newsgroup from time to time
and it sounds like people have left Paris completely or are using it in some
periperhal capacity.

I followed the instructions from the parisfaqs.com website when I did the
original install but it doesn't really give instructions on which
configuration to use. Also, it seems like I can build a mix, but then when I
reopen the file it has problems.

Anyway, any insight on any of the above issues would be greatly appreciated.
I like the sound Paris makes so I'm not dissatisfied there. Also, could you
include the latest prices on any of the new proposed software. Currently,
I'm running a P2.4 with 1gb of ram.

Thanks as always

Barry

Hey Barry,
I'd be glad to hlp you in any way I can. Are you using a Mac or PC? If I
get busy and forget to check back on the Forum, please just e-mail me at
 stevecv1@charter.net or go to my website at SteveCoxJingles.com for my studio

phone number.

Hi Barry,

I think the parisfaqs.com has alot of great info, but you are right, there
is no step by step order. It sounds like the best thing I can suggest for
you to focus on is your paris.cfg. Look in the faqs and find the area about
what to change and what suggestions they offer. It makes a world of difference
once those settings are set properly.

You didn't give too much info about your system, so I'll assume you are using
XP... be sure to right click your "my computer" and go into "properties"
and look for "devices". In your devices list will be something like "IDE
ATA/ATAPI Controllers" for 0 and 1. Be sure these are set for DMA and not
PIO. XP loves to default to that PIO junk. Once you change it, reboot!

Lastly, two things to think about or check... make sure your data drive is
a 7200 RPM drive. The slow 5400 or 4200 aren't good drives for Paris i/o
data. And drives are very cheap. Replace it if it is slower than 7200.
 The last think I can think of is.. if you are using XP, is to turn crap
off in your services. Which ones? Well, that is hard to cover, but you
can do a google search for audio devices turn off, or something like that.
 Here is a quick one and normal devices that hog resources, so turn them
off...

 http://help.cnet.com/Audio_System_Components/9602-12576_39-0
.html?messageID=2505922&kw=Audio+System+Components&n odeId=6462

Hope this helps you... Good luck!!!

~ Ed

Thanks for the suggestions. I'm using XP with a 7200 drive. I'll check the areas that both of you suggested and see if it makes things run better.
