
Subject: PS suggestions

Posted by [brandon\[2\]](#) on Sat, 03 Mar 2007 00:57:28 GMT

[View Forum Message](#) <> [Reply to Message](#)

A PS in comp I built for a friend blew some caps the other day and he had to replace it.

I have the same PS in my comp and if you guys recall I beleive I posted here before about how sometimes I have to hit the power button 9 times before it will boot up. The power will kick on for 1 sec and then go off completely.

I was thinking that maybe my PS was flaking out too.

So rather than risk it crapping out later and damaging my MB I am going to purchase a new PS.

I need suggestions on good top of the line PSs.

My friend ended up getting a Thermaltek at the suggestion of our local electronics store (Frys). I would like to keep it under 1 hundred, but hit me with suggestions for anything more if it is worth the extra cash for the quality.

Thanks..

B

I got a regular 'ol 600W Antec at CompUSA a few years ago & been runnin' it ever since... I think it was about 60 bucks (at the time). Nothin fancy-schmancy, just a regular plain-Chevy Antec.

Just put one in my wife's new computer. Very quiet. Lots O'watts.

cheap too.

;o)

Hi Brandon,

Antec Neo550

Antec Phantom 500

Or any of the Thermal take Tough Power series

These are all quiet one. There are many high end server ones but they sure ain't quiet...

DO NOT skimp on wattage or quality just for the quiet part. You will not find a quality power supply under 100 bucks. I would not recommend anything under 450 watts for a system made in the past 3 years,. Shitty power supplies are cause many of peoples computer troubles. A shitty power supply has the same effect on a computer that one would in piece of pro audio gear. The power supply is one of the first areas people try to cut corners on when it should be the last place. :)

If noise is an issue, you might check out endpcnoise.com. They have some low noise PSs at reasonable cost. The Antec Neo 430w low noise model runs around 85\$. Its best to use the actual wattages you need, as the bigger the PS gets, generally the more noise. I've gotten my PCs so quiet now that they don't need isolation.

This thing kicks ass:

<http://www.newegg.com/Product/Product.asp?Item=N82E168171520> 26

Modular, 630-watts quiet as hell and power to spare.

Highly recommended!

All,

I have been reading reviews and this is the best I have found so far that gives me a warm fuzzy.
http://www.newegg.com/Product/Product.asp?Item=N82E168171530_40
No I didnt pick it because of its positive reviews.
I picked it for its lack of negative reviews.
I looked at cheap to pricy PSUs.
I read the Cons first to get an idea of the manufacturing quality. If the cons arent too bad I will read the pros.
This seems to have everything I need.
Not settled on it..it is just the first one that gives me a warm fuzzy.
Thanks

Hi Brandon,
We use the Thermaltake EPS ones like this on our Opteron and Xeon machines. We mainly use the 750 and 100watt one though ...)
You would be good with this one.

nevermind.....I must be hallucinating again

The one I pointed out is very quiet though, just in case you want to save \$100.00. Not completely silent, but definitely not loud. Anyway, my review of it would have been much more positive than the ones on NewEgg.

Who said anything about \$100???? ;-)

I started comparing the Efficiency rates and amperage on the rails and the Cons people had etc..

This is the first that stands out to me.

I dont want more than I need, but I do want a rock solid PSU.

I've never replaced a PS. Unlike a simple fan replacement, where there are two wires to connect, the PS seems to have several dozen wires to connect to all sorts of places :).

I ask because I have a very quiet room and a Magma in the closet which sounds like a very loud vacuum cleaner. Is there a standard plug on the power supply end which lets you leave all the many wires in place?

I have a thermaltake eps 750 watt in my video machine and the thing is whisper quiet. 14 cm fan, 85% efficiency.

highly recommend it. i think they have a 1200 watt out now, with connectors on the box, no more bungi cords in the box for that unused cable!
