[View Forum Message](#) <> [Reply to Message](#)

Here's the deal. I've been running Norton Systemworks 2002 on my internet comp, renewing the antivirus subscription every year. My subscription ran out yesterday and upon trying to renew it, I was informed it was no longer supported, and I had to upgrade to whatever 2006. Since I've read some of you are down on Norton, I thought I'd ask for opinions on what to switch to. Sooooo....what do you guys like?

I don't use the norton firewall. I use the free Zone Alarm one.
I kind of like the system tune up thing that Norton did. I don't think I've had a crash...ever, on this comp.
Rod

Hi Rod,

Check out www.bitdefender.com and a program named Spyware Doctor. That might be all you need. The combo of the two has kept my kids PC free of spyware, malware, and viruses for about a year now. It was a DISASTER before that.

I have had great success with McAfee. Go to www.salecircular.com and pick your state and on the bottom pick free after rebate. Often antivirus is there for free.

Hi there Rod...Get rid of ZoneAlarm !!! it is totally useless,and causes all sorts of problems.....I also HATE Norton...their software is very "invasive",and probably mostly useless too....

Best way to deal with viruses and network attacks? Install Ubuntu on it. BY FAR the best option, though you will have to jump through some hoops for some kinds of media playback.

If you insist on paying for an inferior Microsoft operating system, as an alternative to Norton I suggest AntiVir or Clamwin. AntiVir is free as in beer, Clamwin free as in beer and free as in speech (it's GPL'd). The downside is that Clamwin doesn't include a real time scanner--you have to tell it

to scan something. I think the XP firewall is pretty decent, I use it on my machines but I also have my own firewall built into my home router. I think Zonealarm mostly just scares people.

But try Ubuntu, after a little bit of kicking around you'll be thrilled you did.

I was watching "Call For Help" a couple of weeks ago on cable, and they did some real world benchmarking on anti virus software, and the concluded Norton and Zone Alarm slowed the computer down by as much as 50%, but that the Windows "one care" had no speed hit at all.
Just FYI.

AVG is roughly on par with AntiVir, and is a similar licensing scheme. They have a free (as in beer) version and a pay version. Clamwin is actually free (as in libre or speech) software, source code and all. I'd say all three work at least as well as the pay software and I'd take any one over Norton.

thanks. I agree about Norton. It's raped my system before, then I found
a little app that finds all the Norton entries and files and gets rid of
them, which sure saved some head aches.

FAR the best option, though you will have to jump through some hoops for
some kinds of media playback.

If you insist on paying for an inferior Microsoft operating system, as an alternative to Norton I suggest AntiVir or Clamwin. AntiVir is free as in beer, Clamwin free as in beer and free as in speech (it's GPL'd). The downside is that Clamwin doesn't include a real time scanner--you have to tell it to scan something. I think the XP firewall is pretty decent, I use it on my machines but I also have my own firewall built into my home router. I think Zonealarm mostly just scares people.

I'm curious, what do you mean by "Raped" your system. I've never experienced what other people are saying about Norton. That being said, I'm not trying to defend it either. If there's something better, I would like to be using it.

This is all just odd to me... reading the great jonesing on McAfee and the

negative reference to Norton as "invasive." I've have always found McAffees stuff to be incredibly invasive and Norton (System works in particular) to be very background, make it do what you want and not what you don't. I recently got a call to fix 2 PC's... each had McCaffee and each was healed with the removal of McAffee. The other thing with McAffee versus any other AV/SystemHealth I've seen is the lack of configurability and the absolute BS it throws in your face that you can't turn off. McAffee has exhibited unwanted unwarranted paranoia about every little thing. Disbale it to install a new app and it turns itself back on to tell you that it believes your neighbor's cat may be using a dial-up connection to email Lex Luther's evil twin in an attempt to have your brother-in-law sent back to prison. Ignore that and it tell you that tomorrow, you're gonna have a wreck and kill 2 nuns and 6 baby ducks if you don't upgrade now. Whereas, Norton just does it job, doesn't fill every available space in your browser bars with marketing hype and your OS with flashing lights and sirens.

Just wondering.. were you using McAfee managed by chance? That thing is a
giant pile of crap, and you'd be dead on to say you get to configure

'nothing' about it. Their A/V I'm ok with, and the firewall I don't like. Zone Alarm and AVG have never once failed me on my personal boxes. Corporate.. well, that's another thing I have to live in a box on. But Norton? Haven't had any kind of luck with it that is good. Nice to hear another POV though, I don't feel quite as trodden upon by Symantec :)

Better, to me, means Grisoft. YMMV. I've been witness to the after effect of specifically written viruses going in and dismantling norton w/o norton knowing about it. Norton appears to be running properly / protecting, when in fact it ain't. That is the real bad news for the recipient. Think of it

this way. There is a reason the big guys get put in the sights of every little hacker wanna be. They are dominant, they bring the most 'glory' to the little hacker that could. Same reason MS keeps (and believe me, Mac is going to follow on the hit list) getting pants'd... they're the *big guy* and a big target brings a lot of crosshairs on it's butt to the party. Grisoft, Trend Micro, maybe Panda all fit that big enough to get it done right but not so big they have a target painted on their heads.

Subject: Re: OT: Should I dump Norton??????
Posted by [TCB](#) on Fri, 26 May 2006 13:53:23 GMT
[View Forum Message](#) <> [Reply to Message](#)

We use Symantec corporate where I work. It's not nearly as invasive as the consumer versions. Remember I'm a professional geek, so for me control is a huge part of what I want from my computing environment, and consumer Norton does spread itself all over the place. It inspects web pages viewed,

tries to scan network drives (big no no in a corporate environment), and if you watch the taks manager it's always muddling around doing something. It's also awfully chatty with the remote Symantec servers, which is understandable (virus definition updates) but the precise thing I would like to know about is when a machine on my network is talking to another machine on the web.

Anti-virus software also creates its own single point of failure in the event that the antivirus software has a problem. As in

<http://www.eweek.com/article2/0,1895,1967941,00.asp>

200 million computers running Norton and they may ahve left a huge security hole in their own software. Monocultures are bad for software just like they're bad for nature.

In my experience the free tools are at least as good as the pay tools. They also offer a little security by obscurity improvement because they aren't as common as Norton. I still say, though, that good computing practices + GNU/Linux is the best way to avoid this stuff.

I'm using Norton here along with XSoftspy. Between these two, I'm good. I wouldn't put it on an audio machine though. Works fine for me on an office rig, but there is a small performance hit.....to be expected, IMO. The only problems I've ever had with Norton was getting my head around a few issues with Norton and networking, so I enlisted a young geek'ster to do it for me so I could watch. I think I still remember and IIRC, it was easy.....(now WTF did he do?)

;o)

It was their regular "suite" the user had purchased at Costco. And I'm with you on Symantec. I currently use NAV Corp Edition 8.1.x I forget it's there until it notifies me in the manner I told I want notification of a virus or potential virus.

Dubya
