New thin MacBook Air just announced. [www.Apple.com](http://www.Apple.com)

The track pad is multitouch now. Optional solid state drive. A bit slower CPU than the other MacBooks but not bad.

It looks pretty cool for something that light. But right now I need a heavy lifter 17" HD res box, so it's not for me.

Also at MacWorld: Software updates to iPhone/iTouch, movie rentals, a wireless backup system, and an iTV update.

No refresh for the other laptops (what I'm waiting for) yet. Dang! I guess they'll sneak that update in sometime between now and NAB, much like they did with the MacPro last week with little notice or fanfare.

I'm expecting LED backlighting on the 17", updated CPU and chipset for more speed and battery life, and now I'm expecting a multitouch track pad! Hope it doesn't take months...

Cheers,

-Jamie

Jamie - Sorry there weren't other new laptops - maybe soon.

Air looks interesting - big price difference between the PATA 1.7Ghz version and the solid state 1.8 - \$1799 to \$3100 - ouch. I guess solid state has a ways to go to be cost effective. 64G is a lot for solid state for now.

In 10 years, we'll laugh at these early sizes as we buy 100TB solid state laptops with touchscreens for \$500. ;-) lol

Getting ready to pick up the iPod Touch update (yep, got one before Christmas)

I'll let you know how it is - looks like some cool and much needed and really nice additional apps!

Woohoo! Email on the iPod touch!

Dang - started the latest minor update (165M on DSL.... zzzz) before seeing the new features update. It will be a while before I can buy and dl the new

major update.

Yeah, bummer! But it'll happen. I can wait but hopefully it won't be too long. I'd also like to see them make the hard drive user swappable so I can easily add a solid state drive when the prices come down.

Yep. Or it'll all be wireless into our brains, no touchscreen needed. :^)

Yeah, and notes, too. The Touch is starting to look like a useful little device. Should my Psion start getting nervous?

HD is only 80GB (or 64GB if you want to spring for the solid state drive option). If that's enough space to add Debian and XP, bootcamp should support 'em. Or use one of the virtual machine setups if you want to switch between OSs on the fly. CPU is 1.8GHZ I think. Slower than the bigger/heavier laptops but still very capable.

Well, the update toasted my iPod Touch -- minor oversight on Apple's part: Vista loses the iPod driver when iTunes tries to start the update process and can't recover it/find it. It's toasted now - no OS - just keeps looking for a recovery boot (there is no CDRom to boot from). I'm off to CompUSA to hope they can fix it, otherwise, it's dead and going back to Apple, with a request for some freebies for this pos design.

On one of my WinXP PCs, it just bluescreens when trying to update the iPod Touch. On the other, there is no driver for it to find, and with no boot CD, it's history.

This laptop has pissed me off for the last time. It's getting reformatted with XP, or put on eBay. I'll probably have to reload all of my CDs onto the iPod now....

Guess this is Apple's (yet again) way of crippling their software on PCs to force people to buy Macs. What a joke.

Yikes! Good luck bringing the dead back to life!

My Psion just reminded me that it already has a solid state drive (16mb internal plus compact flash that's currently at 128mb); that it has a real keyboard and a touch screen; and that it doesn't blow up. But then I asked where are its updates, wireless web browsing, and music and movie playing. Then it said OK, right, fine, but it can record audio, and the Psion calendar has a full year view.

So based that conversation, and your experience with the Touch update, my Psion is safe...for now.

Cheers,  
-Jamie

I'm looking for a new portable, and saw the hype on this. If I can put Debian and XP on it I'd be sincerely interested, as long as the hardware specs aren't too horrible and they don't have massive hardware issues out of the chute.

Yikes squared. Apparently there is a bug either in the update process, or it's Vista integration. No PC could find a driver for it to restore it. I had to take it home and restore on our Mac. At first iTunes couldn't find/connect to the backup/restore server (here's where I was really getting angry). After about a dozen tries it finally found it.

It's reloading my songs now... so I'm back to work and let it do its' thing alone, in the punishing loneliness of a computer desk - fitting punishment, imho. The new apps will have to wait for another day - I'm also grounding it for a week, and limiting it's YouTube privileges as well.

Really frustrating. Yep, your Psion is safe.

Yeah, it's a lightened sub-notebook. No room for all that stuff. Great for the market they're aiming it at, presumably. But not what I need

right now.

However the Air's optional external USB optical drive is interesting to me. Maybe I could take the internal DVDR out of my next MacBook Pro laptop and put in a second hard drive, that would be useful. And use the external DVDR that was just announced today for few times I'd need it with the laptop. Hmm.

Cheers,  
-Jamie

Glad it came back to life! Grounding is fitting punishment, and I'd cut off its allowance, too!

Cheers,  
-Jamie

Drive space isn't much of an issue, this would be mostly an office/travel laptop, my music laptop is already tricked out with a 250GB drive. Also SSD drives are just way to expensive now.

I'll keep an eye on this. If they don't have any of the usual dying batteries/cracking cases problems that a lot of first gen Apple hardware has I'll give one a serious look.

Never mind, I take it all back, it doesn't have ethernet. Nice job Apple, leave out a ten cent part on an \$1800 laptop so I can't use it in my office to talk to my servers securely over a wire.

No firewire? Pretty much kills it for what a film producer friend of mine was hoping - in-field video capture.

In a few years, most laptops will have solid state drives though. Someone had to be the guinea pig and make a first one that few people would want.

Jamie,

There's plenty of room for FW and ethernet, and those should not be considered luxury items. They're necessities on any computer these days. Why apple didn't include them is beyond me.

TCB

It looks to me like the design philosophy was "do everything you can to make it thinner." Clearly they wanted the bragging rights of having "The Worlds Thinnest Notebook" as they currently trumpet on their web site.

It's a faster subnotebook than Sony's, too, and less expensive apparently. So in that market, this little beauty should make a splash.

To get there, the battery is not user-removable (like iPods). There are minimal i/o ports. No expansion port. The CPU is a special sized-reduced model from Intel. Etc.

However, I just read that you CAN get ethernet from Apple via a USB to ethernet adapter for like \$30. If that helps.

In the end it's just another choice. When evaluating the available Apple laptop options, it's apparent that the regular MacBook is very comparable to the Air. The regular Macbook is almost identical in features with only slightly more weight, but with all the i/o ports, a faster CPU, user replacable battery, user replaceable hard drive, and lower cost. If I were you, assuming that the Air is sufficient for your needs except for the missing i/o, I'd get a MacBook.

The MacBook Pro is also pretty much the same thing but with an expansion port, faster graphics, and higher res screen choices. If I were me, and I am, I'd get that. :^) Primarily to cover the video/graphics/animation stuff I do - the audio stuff would be fine on a regular MacBook.

Cheers,

-Jamie

Here's a USB2 to Ethernet adaptor that Apple is supplying for \$20.

<http://store.apple.com/1-800-MY-APPLE/WebObjects/AppleStore.woa/wa/RSLID?nplm=MB442Z/A#overview>

I'm sure there are USB to Firewire adaptors available too.

Adding adaptors is second best I guess...

Sorry - it's \$29, plus the cost of a hub if you need other inputs simultaneously.

My point is that it shouldn't be necessary. Ethernet and at least one fw port should be standard on any computer at this point. I have no clue why they chose to exclude it.

I thought you were talking about buying a laptop for yourself.

If you're specing a machine for someone else that you support, and you think there's a possibility the airport capability might fail, you'd have to include the USB ethernet adapter.

It has a secondary networking option: that pesky USB to ethernet adapter.

Cheers,

You're missing my point. Let's say I have a user in Bangalore who just blew out their wireless drivers. I can say, 'Go to the business center (or plug in in your room) and call me on your cell phone.' I can walk them through fixing their machine. With this Mac I'd have to say, 'Go buy a USB pen drive and borrow someone's laptop that works and call me on your cell phone.' Busy people traveling don't want to hear that.

I know I think like a tech, so I'm not really on Apple's wavelength, but to me not having a secondary networking option is fundamentally bad computer design. It's asking for trouble.

that  
mark. Probably find a niche with post gen-x business travelers that live on  
wifi and  
thumb drives.

Not the solution audio and video people would want, but like Jamie said,  
we still have other laptops for that - just not ones thin enough to  
accidentally  
bend in half, or send with a fax... ;-)

Imho, connectivity needs a little update - perhaps a snap locked fiber port  
with 10+ G/s speeds. 1394 is too loose of a connection design, and 1394c and  
faster are no  
where to be seen yet (not to mention that most laptops use the smaller  
unpowered 1394 port).  
USB is too slow to be the defacto data port on laptops, even though it  
is.  
Fine for smaller or low bandwidth devices, but too slow for data backup of  
any size.

My .02.

Dedric

Microsoft and Intel invented the whole USB concept, when Apple had the Apple Desktop Bus since the IIgs model.

At least the pro Macs still have firewire. But that was one of the reasons I bought my iPod Photo and didn't hold off for the iPod Video. Mine is the last generation that uses Firewire -- the next model will still charge via Firewire, but will only sync up via USB2. And when I bought it, I only had USB1 ports and refused to buy a separate card.

For some reason S3200 has been painfully slow to come to fruition, as was FW800. Maybe Apple sees the end of the road for 1394, or just a lack of consumer adoption (non-A/V world) - it may be a bandwidth limited design. And with 3G SATA, it's hardly a competitor for large data storage at 800Mb/s max currently, but certainly far better than USB2. I wouldn't be surprised to see another format emerge with much greater capacity.

I also think the connector format is way too loose for high speed, high risk reliability. And, firewire/1394 is far too susceptible to destroying ports during hot swapping, though it's supposed to be hot swappable.

Neither USB or firewire is a long term high speed data transfer solution, imho - just two more incremental stops along the way. Might take someone besides Apple to come out with a faster solution (other than Ethernet).

Dedric

I was disappointed when they dumped the FW on the iPods. Most of the Macs I own have USB 1.1 which is really slow, and doesn't work as well as FW. They left out all the people that have external FW drives with this lap top. Their answer is for us to spend another \$300 to \$500, and un-securely back up over the air. Some times they are just too whiz-bang, consumer oriented, they need to think prosumer.

I wish Apple would stop building obsolescence in to their products. They have put iSight cameras on the iMac and all the lap tops, why wouldn't they put one on the iPhone and the iPods? Why not add a mic to the iPod so you could do dictation or record lectures. I hate having to buy add on doodads. The whole idea, is suppose to be portability. I don't want to carry more stuff.

Another indicator that this was a bad move is Apple's stock price, it's dropped \$35.00 to 40.00 a share. Hopefully they get the message.

Yep. But the Dow is down, too. The Fed does not seem optimistic:

[http://ap.google.com/article/ALeqM5hwHbki86OAoUhqDveb6JLDol\\_4-gD8U78C780](http://ap.google.com/article/ALeqM5hwHbki86OAoUhqDveb6JLDol_4-gD8U78C780)

"Separately on Wednesday, more big banks reported losses and said people were having trouble making payments for everything from credit cards to cars. Stocks were mostly down for the day, the Dow Jones industrial average declining 34.95 points, or 0.28 percent."

And here's a story about typical post keynote Apple stock performance patterns:

[http://www.businessweek.com/technology/content/jan2008/tc20080116\\_282937.htm?chan=technology\\_technology+index+page\\_top+stories](http://www.businessweek.com/technology/content/jan2008/tc20080116_282937.htm?chan=technology_technology+index+page_top+stories)

So is there a clear message in Apple's stock price? Dunno. Interesting stuff, though.

Cheers,  
-Jamie

Citicorp posted a \$10B loss last quarter with layoffs in the works - the biggest loss in their 196 year history (196?... guess so).

They are in trouble, but will still probably recover. That alone and a the inflation report has Wall Street scrambling. Apple is probably just a casualty since nothing they could introduce, other than an economic injector device could reverse that. ;-)

not really. they're just addressing the dumbed down market they've created. i'm still waiting for the 5,000,000 song ipod to come out.

Every PC I've set up in the last three years has had at least one FW port.

I think that had a lot more to do with Citibank writing off \$19 billion in bad mortgage loans. Like or not, markets tend to move monolithically. Then again, Sun got a bump by buying MySQL so maybe the market did look dimly on that stuff.

The MacBook air is definitely innovative. There is nothing on the market that is that thin, with that much battery life, and is that light with that big of a screen. I think they tried to cut corners and maximize profits too much, and forgot real customer needs in the process. The design may have not allowed for the FW port, and Intel may have had something to do with the decision. If you watch the keynote video on Apple's web site, and fast forward to the MacBook Air, you'll see the size of the MOBO is incredibly small. I'm sure it's great for the guy that has to travel all the time.

However, I would have rather had a bit thicker MacBook with more ports and an optical drive. For me, the regular MacBook is the way to go, It's faster and it's \$700 cheaper.

If the cost was \$999.00, we'd for give them for the lack of a FW port, although, I still need FW, especially on a portable.

yeah but they'll probably have to beef up the cases to protect the thinner laptops. i'm not being negative here on the product i'd rather see the innards improved and bugs ironed out.
