Hey Guys,

As I have posted before I am using Win 98, But for the last month I have been looking for a computer that has XP, and I think I have found a gem.

My wife is a RN and about a year ago she became a traveling RN. Right now she is working in Columbia, SC at The Richland Palmetto Health Hospital.

So one night she asked some of the other nurses if they knew where the Surplus

to give her direction to the store, when another nurse joined in on the conversation

So with all that said, will this work.

AMD Athlon(tm) XP 2100 + 1.73 GHz
512 MB of Ram 1 AGP Slot 5 PCI Slot

Man! what a find. I Think

If this will work:

- 1 Should I run an Antivirus before installing Paris and then delete the software? (Paris use only)
- 2 What should I delete from the system so Paris can run smooth?
- 3 What should I do or not do before installing Paris?

Personally, I'd wipe the system and use whatever system restore/Windows XP disc came with it.. assuming one did. If not, then yeah download <http://free.grisoft.com> the free version of AVG, complete scan/clean it, and if you will never connect to the internet you can remove the program. However, it's free so I would probably just kill the services when I start up because you never know when a client might bring you a 'present' on a CD, DVD or hard drive with their project. You'll also want to run a clean system sweep for spyware. Windows Defender oughta cover that, and it's free also from www.microsoft.com if you need it. While you're connected to the internet, also check for any driver updates, but don't get 'feature rich' on the software. Base drivers only. Don't get a bunch of windows updates pertaining to security and network either, just slows down the system. Memory serving, my Paris machine uses something like 0%~1% CPU at idle and 80 Mbytes of memory before launching paris. That is Service Pack 1 and no internet/security updates... it 'never' sees the internet. FWIW, I'm using an AMD 1900+ in my Paris rig on 512 RAM. A 600w power supply was enough to run a UAD, 2 video cards and 3 EDS cards, if that helps you gauge power requirements.

- > 2 What should I delete from the system so Paris can run smooth?

It's more about killing unneeded services. www.musicxp.net

- > 3 What should I do or not do before installing Paris?

Make sure you have a solid system first. Buy an image program, image the disc. Update the image as you move along in the install process. Check with the motherboard manufacturer to see which PCI slots share IRQ's. Don't put an EDS card on with video IRQ slots (usually the AGP and the one next to it, but not always). Make sure the power supply is up to snuff for running the amount of EDS cards you plan to put in it. Use a 2nd hard drive for audio data. If you're not using stuff like the network, USB or firewire (or COM

ports for that matter) disable them in the BIOS if it's onboard.

musicxp isn't as easy to get at now... instead try this:

<http://www.blackviper.com/WinXP/servicecfg.htm>

Hey Aaron,

Thanks for the advice and no a disc did not come with it. I just brought

the Trend Micro Anti-virus plus Anti-spyware is this a good idea or not compared to the one you recommend.

Hey Terry,

It could be a good idea to get a program like "Everest" by www.lavalys.com .
Then you can get all informations you need about your "new" XP computer,
what motherboard-type, what legal XP number, what kind of memory etc. etc.
etc.

I believe you also must change the powersupply. Get a 500-600 watts with a
big slowgoing lownoise fan, that can be used with that old board.

Well, this is interesting . . . I too have been running PARIS in Windows '98 on an old PII from the year 2000 or something, and I was also just given a much newer computer with XP on in. I don't even know what's in it yet, cuz I haven't fired it up or cracked it open, but the idea is to install our other PARIS system in it. And I, too, am an RN, though not a travelling one. I'll pay close attention to your responses, so I don't wind up asking the same questions. :)

SHAMELESS PLUG ALERT

We're working on our second all PARIS CD album now on that same old beat up computer, but in case anyone missed the first . . . it can be had at www.sarahonin.com/wayward.htm or www.cdbaby.com/sarahonin or on iTunes and a bunch of those other song downloading places.

CD #2 is called "Angel Food" and demo samples will soon be posted on our site.

Thank you, and have a lovely tomorrow,

Sarah

Hi Terry,

This sounds like a really good PARIS machine. Here's what I would do:

Partition the drive and have Windows 98 and Windows XP installed. You'll need the installation CDs for both. You also need to be mindful that Windows 98 requires a third party driver to access a hard drive larger than 120GB.

The Windows XP driver can still be tempermental. Keep 98 around just in case.

Also, Windows XP requires at least 1.25 GB of Ram to work well for Audio. The disk cache will try to cache your whole project up to 1 GB, forcing program code into the swap file and bogging down the machine if you only have 1 GB or less. It drove me nuts until I got more than 1 GB.

I hope thses suggestions are helpful!

Mike
