---

To James & all you mac guys,

I bought a Mirror Door Drive G4 mac (single processor) on Ebay about a year ago, with the idea of making it my Paris machine, but I thought I would test it first without Paris. At first it seemed to work fine, but it soon started freezing up, usually after a few hours of use. I opened the case and put a 12" fan pointed directly at the processor, and it worked perfectly for awhile, but after a few months it was back to the old tricks. Definitely heat related, as it's worse on hot days or if I keep my computer closet closed with the light on.

Any ideas on what I might try?

Thanks,  
Dale

We still have a "Classic" around here somewhere if you need a spare... ;-)

David.

My Dual Mirror door G4 dual 1.25 runs hot as well, but I've never had problems with freeze up. Your problem may be hardware/heat related, but my first

guess is software. There was a firmware down load related to heat and noise. I would check Apple's support site for the latest firmware. Are you freezing when running OS 9 or OSX? If your freezing in OS9, don't forget that OS 9 does not have protected memory, so you may need to allocate more memory to programs. It was the biggest flaw with Mac OS 9 and prior, users would forget to up the memory for all the programs they are running and they'd get a lock up or crash.

I hope this helps!

thanks James,

If I make this machine my Paris rig, I will be running OS9, but have not tried that yet. I'm currently running 10.4.9, but also using Classic. I think it freezes up with classic running or not---but I can try not using Classic and see if that makes a difference. Do you think I need to change some kind of settings in classic? Or allocate more memory to OS9 apps? I thought OSX automatically handled memory.

Thanks,  
Dale

Mac OSX has protected memory, so I'd check the support site for the latest  
firmware. Is the machine locking up running OSX? Do you have an Apple retail

store near you?

I downloaded the firmware update, but when I run the installer it says I must be booted into system 9. It is my understanding that in order to install a bootable system 9, I need the original install disk(s). I have a single install disk, but I've checked several apple forums, and unless I am missing something, the system 9 install stuff must be on a different disk that I don't have. The local Mac store won't sell me a replacement disk(s), but they say they will install system 9 onto my machine for \$45.

Obviously, it would be preferable to have the disk(s) so I can re-install system 9 if/when necessary in the future.

I looked on Ebay, and there is a set of 4 install disks for MDD that is up for sale, which I will try to bid on.

Does anyone have any other ideas on how to get these disks?

Thanks,  
Dale

Did you check to see if OS9 is already installed? You can check by going to system preferences, Start up disk. If there is an OS9 folder in there, click on it and hit restart. I don't however think this will help you with OSX freeze ups. I would make an appointment at the Genius bar at your Apple store and have them look at it.

OS 9 (Classic) is installed (on more than one HD), but when I go to system Preferences / Startup Disk, the only Systems that show up to select to boot with are the OS X ones. It's my understanding that even a dragged-over system 9 will work for classic, but to make system 9 bootable, the original disks (set of 4, I think) that came with the MDD must be used.

What I'm wondering is, can these original MDD disks be copied? If not, then I guess I will bid high to try and snag the ones on Ebay.

I would call 800 SOS APPLE and see what the restore disk would cost. I would tell them you misplaced them. At one time they would send them out for free.
