Howdy, kids. And thanks to Erling for the help with the AIFF > WAVE file conversion via iTunes thing. Worked perfectly. Honestly, I'm still trying to get used to the Mac OS, but that's another story.

I was trouble-shooting a fresh round of freezing issues, checking to see if the wireless network card I just installed in my Paris computer was interfering with the EDS card on the IRQ sharing tip, when I realized that my EDS card is not recognized nor does it have a driver in the Device Manager. It's listed as "Multimedia Audio Controller" and does not have a driver installed, according to Windows. I have gotten some work done since installing the network car, so the freezing is intermittent, but it's getting worse real fast. But two days ago I worked in Paris all day without any hiccups, same exact configuration.

This computer was stable as a rock six months ago when I last used it. Should I just uninstall and re-install Paris? How did the EDS card get "unrecognized"? The last time I had freezing problems it was IRQ sharing difficulties, but this big yellow question mark in Device Manager where the EDS card ought to be is weird....

Jimmy

Jimmy,

I'd remove the WIFI card first and see what happens.

Your EDS driver isn't being recognized. That's for sure. I have had the same thing happen when overloading a PC with various devices that would not share IRQ. I don't use WIFI but I have heard stories about WIFI not sharing nicely with other devices. If you've got an IRQ conflict, at some point, the system will make a decision for you as to the driver it recognizes and even if you reinstall the Paris driver and it is recognized, it may override the WIFI driver and you may still have problems.....or maybe not.

It's DeeJ!

I did remove the wifi card, with no success. I think maybe my audio drive is waaay too full? Just old fashioned streaming problems? I'm going to clean off the hard drive and see if that does it.

I wish I had the coin to get one of the Magma chassis thingies. I've still got the notes I tok back when we talked on the phone.

Hey, come to think of it, do you ever go to Survivalblog.com? Pretty col website, and little extreme for me, but loads of practical insight into how to prepare for really hard times. Not too kooky, either. There's a lot of folks out there getting ready for a big crash....

Jimmy,

To my knowledge, a full hard drive wouldn't cause your EDS driver to disappear.
It could definitely cause throughput issues though.

They're pretty handy to have. Especially the newer ones that can interface
PCIe cards.

If you want to discuss this, let's take it over the the General site.

Cheers,

Deej

Alright, I was being a little stupid. That yellow question mark was for the

onboard audio, I think, not the EDS card. I found a Scherzo driver elsewhere in the Device Manager.

I also cleaned both hard drives, and experienced much better results. But over the course of three hours I did still have 2 freezes, each requiring a restart of Paris.

Are there any mods I can make to the config that would fix this?

Thanks for indulging me.
