Subject: INSTALLED PARIS 3.0 on XP PC....NOT WORKING
Posted by kekenalii on Sun, 16 Aug 2009 04:01:33 GMT

so my paris system i bought on ebay came loaded with 2 eds cards on a mac g4. a c16 and fully loaded mec. well it didnt work. it froze whenever i opened it on the mac. I never could get the c16 to power on either.

so i decided today to install it on my XP PC...well that doesnt work either. It shut down my pc 3 times just upon opening it, the c16 still doesnt light up and where do I get the response to the challenge from? I'm assuming support@intdevices.com ?
I followed the instructions on mike audets multicore driver cdrom, and i also followed this page as well: http://www.kerrygalloway.com/WikiPARIS/wikka.php?wakka=WinXp DriverInstallDoc

this is so frustrating. i spent about $2100 on this system and its still not working.

i dont know what is wrong with this paris system that i bought, but its been a nightmare. i bought it about a year ago and its been nothing but a headache. the mec and the c16 look brand new with no scratches at all.

can anyone help me out?
