Subject: Trim gain control in Paris

Hi,
I'm attempting to set individual channel levels to +2db on a VU meter when
the channel is solod and the fader is cranked to +10. Unfortunately the only
VU plug in I have is native and so can only work on the inserts. Which means
I can't use an EDS comp to set the gain since they're post native inserts.
And the channel fader won't have any effect either. Still, figure I could
insert a native plug to control the gain before the VU meter plug. Any idea
what plug in I could use to do this without introducing artefacts and without
introducing unnecessary load on the CPU.

I could use Waves L2, though that will have artefacts (not necessarily a
bad thing) and increase CPU load.

Thanks for any thoughts.

Dan
