Where's the fuel? You mean you finally noticed that Apple has gone to Intel for hardware designs, and onboard graphics on the low end models?

This is pretty old news. When Apple announced the Intel switch more than a year ago, this was one of the reasons given. The Macbook is their low end laptop, and probably the biggest cost reduction was using the onboard graphics instead of something snazzier. The Macbook Pro has the snazzier stuff, but it's still off the shelf with OSX drivers. Apple doesn't and hasn't ever AFAIK developed their own graphics chipsets.

Well heck, they don't develop their own CPUs either, although I imagine they give input to those companies. Up until last year Apple chose different CPU models than were blessed by Microsoft, and tried to gain an advantage from the differences. Now they are using the same CPUs that Microsoft likes, so any advantage is going to be from design and software.

I like Apple's desktop case design. Really easy to get into and change memory, drives, etc.; quiet and cool running airflow. The laptop designs have varied at accessibility, sometimes compromising for thinness. For example my PowerBook is easy to access for memory upgrades but not for HD upgrades. That may have changed in the new ones.

Mac laptop sales are rising, other manufacturers are copying their form factor, but if you ever buy one (other than overpaying for a Macbook for someone else, and then complaining about it) I'll be amazed. Sorry you had to subject yourself to working on a Mac today, but even sorrier you had to infect it with XP. ;^)

Cheers,  
-Jamie

So, I had to set up XP on a Mac Book today. The child of an important person on my office had one and, surprise, most of the games a 12 year old likes to play don't have Mac versions.

So, once and for all I can put to rest the notion that Apple hardware is somehow 'super special' and thus justifies the higher price. Intel chipset, Intel integrated graphics, Atheros wireless, Marvell NIC, generic firewire controller. The CD/DVD burner was the slot loading kind, so that's slightly cool (unless you want to pop out the CD before the machine boots when it's nice to have a physical switch), but that's about the only thing unusual about the hardware. If you were to show me the XP device list for a Mac Book and the same list from a Dell 640m (two of which I've also set up recently) I would have given a \_slight\_ preference to the Dell, mostly because it uses an Intel wireless chipset that does b/g/n and bluetooth on one chip, and I've had very good luck with those wireless cards. A 640m also has a larger screen and costs around \$750.

In better news, I wound up on modular synth dreamland for about five hours last night, wiring up my John Bowen Pro Wave into modular patches and using it to feed vocoders and all of the things that make computer recording worth it. Then I forgot to save the presets, but hey, that's the way it goes.

You forgot one major thing; you can't run OSX on a Dell.

Ah those guys SUCK! Just kidding!

Being a drummer, I've seen them several times, there a great band, it will be a great show. I've even seen them at the NAMM show a few times. Morgenstein and Morse rock! Have fun!

That's right, Jamie, I finally noticed that Apple is using Intel processors.  
You know me, never up on much in that wild and crazy world of tech.

My point, which I stated fairly clearly, was that I have often heard the  
argument made that the reason Apple hardware is pricier than an equivalent  
Dell or home build is because they use superior components in their machines.  
That's nonsense. Having seen their 'low end' laptop which runs about \$1300  
I can say for sure that aside from the slot loading optical drive and a nice

black case it's a slight downgrade from a \$750 Dell. If the optical drive and case are worth 45% more to you, than that's fine.

BTW - Debian Etch is relatively easy get working on these. If I had more money than sense I'd get one as a Debian machine because it's black.

Hey Thad! I was checking Dell's prices, I didn't see any Core 2 Duo lap tops for \$750.00. I could be wrong, but it looks like they start at \$1299. I wonder what they would cost similarly configured?

I think Apple typically makes more margin per unit, well that's what I've read. As a dealer margins were always tight. In the past Apple manufactured

proprietary hardware, and they just didn't sell the number of units that PC manufactures did to have low prices. With Intel, it's a whole new ball game for Apple. I would think Dell still buys 10 times as much stuff from Intel as Apple does. Dell probably gets better pricing.

I have seen Dell do a thousand dollar rebate on their lap tops. When that happens, Apple will not be able to compete.

Guess not, for Apple anyway. This is old news. Processors, onboard graphics chipsets on the low end, and, heck, doesn't Intel do the entire motherboard now? So now, what were you complaining about?

The black laptop case was worth an extra \$200 to you. But I would have bought the white one. And I would have bought it at a discount through one of those sources we told you about.

It's odd to hear you complain about Mac prices, and then when you get a chance to buy one (for someone else), you pay MORE than you have to, only to complain about it. I can't figure out why people come to you for OSX Mac advice, it's obviously not your forte and you hate 'em.

Granted, the argument for Apple hardware superiority has been made in the past, when Apple did their own motherboards, fancy cooling designs and chose different processors than those blessed by Microsoft.

But that was then. Your rant is out of date. The difference now is mainly software and design. Not insignificant areas, but it's a change.

A "glass half full" kinda person, would probably see this as a good thing. Apple leveraging standard components, fast new processors, BSD, and adding value in design and software. Based on Mac sales, there seems to be a thriving market for that. (Not with you or LaMont, of course - but that's OK, someone has to buy the other stuff to keep the overall market somewhat alive, so thanks.)

For my part, I am not complaining about my "old" dual G5 with an Apple designed motherboard, and "obsolete" PowerPC processors that kick through my work pretty dang blazingly (PDB), on an almost unusable OSX operating system. Oops, I was channeling you for a second there. Meant to say, a reasonably elegant OSX operating system. :^)

BTW, I was surprised by the change in direction at Apple. I haven't needed an Intel Mac yet, but it looks like the current machines are decent and fast. Since my current main production machine is doing fine, I can afford to wait for a few more dishes in the buffet, such as desktops with 8 CPU cores, and laptops that can address more than 3GB RAM.

It's interesting to hear all the complaints about Apple seemingly rooted in the past. That's where most of my Apple complaints exist, too. Like OS8 and 9 having major multitasking and memory allocation limitations. And Logic losing soft synth output. Those were NOT the days.

Glad we're past all that.

> BTW - Debian Etch is relatively easy get working on these. If I had more > money than sense I'd get one as a Debian machine because it's black.

You go, bro! And while you're at it, since you're good at this stuff, get some of that Linux audio software working better so we can all move to open source. Then we'll have nothing to argue about. ;^)

Cheers,  
-Jamie

Awesome show. First show of the tour. Steve said they were able to do a quick tour because everyone was available for a short window of time. They all seem to be pretty busy with other projects.

It was the most recent lineup, with Dave LaRue on bass and Jerry Goodman on violin, along with T Lavitz, Steve Morse and Rod Morgenstein. LaRue, Morse and drummer Van Romaine played first as the Steve Morse Band. Later Romaine joined the full Dregs lineup for their encore which started with a blazing drum duet.

There were some minor stumbles with arrangements here and there. First show kinda stuff. Didn't phase anyone. Amazing players, and a great night of music.

If you have the chance, see this tour.

Cheers,

Core Duo laptop, 15.4" screen, DVD burner, 1 GB memory. \$750

There are better deals on occasion but this is the current sweet spot. I set up two of them last week.

Pardon me dropping in uninvited.... but...umm... what exactly are you guys  
arguing about? ;-)

An Intel cpu is an Intel cpu. Don't know what motherboards the new Macs  
use, but undoubtedly they are also available on Newegg or TigerDirect for a  
PC - the same goes for every other part, other than the case and the OS.

The Motorola boards were made for Apple (probably exclusively) because,  
well, no one else used Motorola cpus for a PC (mostly for other hardware  
devices). I learned assembly language on 808x and 68k processors - Intel  
and Motorola. Both do much the same thing, but with a different framework -  
68k's were a little better suited for graphics, but not so much for math -  
vice versa for the Intels, though the differences were more in the structure  
and form of the instruction set, rather than actual functions - that's the  
main difference the later versions inherited. The problem with Moto is they  
couldn't get their clock speeds down with their design - it was a limited  
design there. I think it is smart of Apple to finally ditch them and go for  
Intel (or AMD as was considered for a while I believe).

Motherboard manufacturers just make boards to run whatever cpu is selling  
enough to warrant making a board for it, so now you could probably drop most  
any core 2 duo compatible mobo in a Mac and it should run, unless the OS is  
setup to lock out all but spec'd boards, or tolerances with other parts are  
too low.

With comps today, when it comes down to it, the only real difference is what  
the GUI and the logos look like.

The rest is no more of a variation on a theme than you get going from  
Borders to Barnes & Noble.

Regards,  
Dedric

You're right Dedic, they're all computers. They have always used similar components and people argued about the differences. Now that they use pretty much the same components, there's still room to discuss what differences remain.

The difference between OSX and, say, Vista, is more than the look of the GUI and logos. While there are strong similarities, different philosophies and implementations create different user experiences. How much of that difference matters to you will influence your desire to waste time on these threads. :^)

But if you just want to get down the hill and don't see much difference in how you get there, a snowboard is as good as skis. No real difference...

Cheers,  
-Jamie

Of course - I was just giving you guys a hard time because you seemed to be

arguing the same point from different perspectives. It's always best to evaluate tech gear for what it is rather than how it is marketed.

>

> But if you just want to get down the hill and don't see much difference

Skis are better :-) ...and it's important to enjoy the whole mountain, not just the groomed runs.

BTW - iPhone is very cool. I don't have a new PDA, or cutting edge phone, so maybe there are other options too, but the touch screen and orientation detection rock. Too expensive for now though. If they come down, I might consider getting one if it isn't too bulky for a phone.

I really thought hard about jumping into this, especially since I wasn't  
accused of hating Macs, but it's worse than arguing politics.

:O)

Don't get a Mac Deej. If we don't hear at least one story every month about an amazing cobbled together Deej DAW contraption, we will die. ;^)

Cheers,

On 1/14/07 1:38 PM, in article 45aa86a2\$1@linux, "Nappy"  
<mgrant01@san.rr.com> wrote:

>  
> Oh ya,did I mention,it runs both OSX and XP

>  
>

Which since they are the same hardware, begs the question as to why any core 2 duo computer can't run OSX. Oh, that's right, Steve J. won't let us. :-)

So...what's the more flexible, cost effective, scalable hardware? ;-)  
This is all in good fun, btw. Just for sake of conversation more than anything....

Serious Q: Can you buy a Mac core 2 duo that is compatible with a quad core cpu? I am doubting it since there are only a few motherboards that support both currently, and I believe the current core 2 duo Macs were designed

before quads really hit the market, but I am curious if anyone knows.

The kicker on this one for me is that I can build a core 2 duo PC today for less than, or about the same cost of the same core 2 duo cpu Mac but with more PCI/PCIe slots, more SATA ports, higher buss speed, more RAM, dual DVI, wireless bluetooth, \*and\* be able to upgrade to a quad core cpu by simply dropping one in whenever I want. (That's what I'll be putting together in the next month - it's already spec'd out and ready to order). That's a significant consideration for me (and yes, I've been through Apple and Dell's custom configurators, as well as a few others - I still come out better doing my own from Newegg).

That's a much better investment for me at least. The OS is secondary for me to a large degree - just a means to an end that depends more on hardware than the OS. Now if I could buy OSX standalone, I could have an AppleggPC running WindowsOSX. I would also mix logos and make a fruit salad. ;-)  
I had considered a Mac this time around, or maybe later this year, but so far the above advantage is still outweighing the convenience of a plug it in and turn it on solution.

I think that's where a lot of audio PC users are (not average users, but power/tech savvy users). It isn't so much about "us against them" as different requirements and decision making approaches - some want to turn on the switch and not think about it; others want to get a fast system and hotrod it even more, and the time is paid for in the gains made in workflow later.

My personal decision making process is simply one of numbers and my own application - if it makes more sense (power, speed, cost, upgradeability, software support without crossgrade costs), then a Mac is fine. So far, that cost has been noticeably higher than staying with a PC. I don't care which anyone chooses, as long as you see both sides equally.

My main reason for entering this thread is to balance what James said about PC users - that the conversations turn into bashing Macs, but I see it both ways. Mac users are also pretty adamant about Macs being an overall better choice. My other reason...okay, it's kind of fun in a twisted sort of way. ;-)  
It's fun to talk geek/tech with other pro audio folks from time to time. Nice diversion from actually getting work done with these beasts. :-)

Regards,  
Dedric

One of those tech web sites (ars technica?) dropped the quad core into a Mac Pro and it ran. No link handy, sorry.

OSX standalone would be great.

Cheers,  
-Jamie

There are some things to consider. To start the Dell cost \$125.00 more to add the Core 2 Duo 1.8GHz, Or \$200.00 more for the 2.0 GHz, so you looking at \$875.00 to \$950.00 to start. The Dell has a 15.4" screen, which I think is an advantage over the MacBook, although some people would Prefer the Compactness of the MacBook's size. Jobs said some years ago that Apple buys the vary best LCD screens, they pay more for first choice and their competitors buy their rejects. I don't know if that's the truth, but I'm sure you guys would say BS!

Anyways, the MacBook comes with a full version of Mac OSX, not a cut down home addition. It would cost more to get XP Pro, so you would have to add another hundred bucks. The MacBook comes with similar software to MS 8, address book, iCal etc..

The MacBook also comes with the ilife suite of software. I would value that at a bout two to three hundred dollars. If you consider say, Acid For GarageBand your looking at around a hundred bucks. You would also have to come up with the following: Comparable DVD authoring software that is as good as iDVD.

A Photo program that is as good as iPhoto for editing and organizing photos and a High Definition video editing software that is as good as iMovie HD.

There is also iWeb for web page building that integrates with iPhoto, GarageBand, and iMovie to up load your multi media to your web Pages, and list your stuff on the iTunes store. It also has integrated Pod Casts software. The iBook has front Row, a multimedia playing and organizing software, with a wireless hardware remote control.

The MacBook also has a built in isight video camera/ still camera, with iChat audio video conferencing software. Built in wireless, including Bluetooth 2.0+EDR, I don't believe the Dell has Bluetooth???. The MacBook also has built in firewire, I'm not sure if the Dell has that??? I don't know about the Dell, the MacBook has the ability to plug in up to a 24" monitor for extended desk top at up to 1920 x 1200 resolution. The MB has 6 hours of battery life, I don't know about the Dell??? Industries say that Macs have better used resale value, i don't know if that's true but it something to consider. The MacBook has the advantage of being able to run more operating systems, thus, the ability to run more software, which gives you more choices.

I think if you add it all up, they are comparable Price wise, and one may have the edge.

And upgrading the machine I linked to with the exact same Core 2 Duo chip that is in the Macbook is a whopping \$75. And you have a wealth of other

options, since Dell figures the person buying the computer might deserve a chance to make some choices about what they buy.

None of which has anything to do with the original point I made, which is that the mystical higher quality components in Macs simply don't exist.

Ah, we were talking about lap tops!

I think your going to see some great desk tops come from Apple in the next few months, I wouldn't count them out just yet!

Since you are talking about audio, I will speculate here a bit and say, I think you may see PC software developers write more programs for the Intel Macs. Maybe even your favorite programs! Adobe made announcements at MacWorld, I wonder what NAMM, Music Messa, and NAB will bring. I wonder if there will be a Logic version for PC??? LaMont will still hate it no matter what;  
) LOL!

Cool - I would hope it would - e.g. there shouldn't be a technical reason why not unless the motherboard doesn't support it. That's a continual challenge for both platforms though - every motherboard isn't upgradeable (at least not beyond a certain point as processors/socket types change), and every motherboard doesn't have the best PCI slot options.

The cross-platform commitment by developers has as more to do with the balance between cost to port and potential sales, so, if univ. binary to MacIntels is an easier port than Motorola based OSX, it makes more sense to do it - crossp-latform isn't easy for anyone though, esp. given testing, maintenance, etc.

Nuendo already runs on Macs, but for some reason the univ. binary version has yet to make an appearance. Could be summer NAMM or even fall for that though. Vegas? I really doubt a Mac version will ever appear.

I wouldn't hold my breath for a PC version of Logic. That was a pretty definitive platform-centric decision at the time, but who knows.

Dedic

I'm building a new one right now with an AMD 64 4800 x 2 CPU that's going to have 3 x EDS cards in it pretty soon. I've had some "issues" with it though. Strange stuff, but I'm getting there. this is one of the coolest mobo's I've ever seen as far as being able to assign IRQ's to individual PCI slots, but,

of course, like Paris, it's a discontinued model and rarer'n hen's teeth. Of course, being a Mac guy instead of a normal person, you don't get to rejoice in the ability to assign IRQs.

;o)

The basic Core 2 duo 1.8 Dell is \$1052, and that is with out any of the multi media software the Mac Book comes with, or the other things I mentioned. I forgot to mention you can get \$100 off a printer or a free printer, after rebate with the purchase of a Mac.

Here is the basic Dell configuration:

<http://configure.us.dell.com/dellstore/config.aspx?c=us&cs=04&kc=6W300&l=en&oc=bndwe4j&s=bsd>

Apple rebate:

<http://store.apple.com/Catalog/US/Images/ChoosePerfectPrinter.pdf>

Apple's other Promos:

<http://store.apple.com/1-800-MY-APPLE/WebObjects/AppleStore.woa/wa/RSLID?mco=3A357264&nclm=Promos>

<http://store.apple.com/1-800-MY-APPLE/WebObjects/AppleStore.woa/6744003/wo/8a2DIIImx7GQU2Ikqa3dIKAsjFm1/1.0.0.21.1.0.8.7.1.4.1.1>

Heh. True, and good thing too. Don't forget to keep track of your costs in all this, so next time we discuss which platform is actually "cheaper" we remember to take into account all these systems you keep building. :^)

Cheers,

Except that no one here or AFAIK at Apple has been claiming such a mystery for the current generation. Which is why no one has disagreed with your point, other than to note that it's old news.

I could use some fuel for the fire though, it's very cold in Denver today.

Cheers,

So how do I get rid of 90% of the bloat that is advertized as being loaded on the Mac? Is that as simple as everything else it does?

;o)

System stuff you can strip out but I would do some reading first. Language  
libraries would be first on my list. Programs, just drag them to the trash  
and flush the toilet. It's easy!

Hey Nappy -

From Newegg.com,  
dual 2.66 Xeon  
Gigabyte server motherboard,  
1G Corsair DDR2 Ram (2x512),  
250G Western Digital SATA 3G drive  
NVidia GeForce 7300 256M card  
Sony DVD/CD combo drive (+/- DVDR), 16x  
Antec power supply  
Coolermaster case  
Windows XP Pro SP2 with free upgrade to Vista:

\$2356 shipped.

Not sure what motherboard or drives Apple uses - I think our last Mac used Samsung. Memory and DVD/CD drive - also not sure. So I may have spent more than necessary on this example. Apple also probably gets a bulk rate on cpus so that can save a little over paying \$700 each as an individual buyer.

fwiw....

Regards,  
Dedric

DJ,  
I know a web cam does'nt do audio. I'm a bit dissapointed in you.  
I'm not trying to make the point that the Mac is a better computer,I'm just pointing out some things that the Macbook has that the Dell does'nt.  
Really my response is to Thad being the PC opposite of James. You seem to forget all his talk of Debian which has nothing to do with audio. I could care less  
which laptop you use as long as you are happy with it. Sure you can build a PC  
Core duo 2 box for cheaper than a Mac,but you can't run OSX on it. If your mad  
that Steve Jobs wont let you run OSX on a PC thats another story. All I'm saying is If you put all  
that hatred for Steve Jobs a side you should see that owning a Mac is not a bad idea  
seeing you have all the software available to you and switching would be painless  
since you would not have to buy all new software. You could run Wavelab if you want as well as LOGic on the same box,what is so wrong about that?

You see,Thad has still not address the desktop Mac which have 2 Duel core Xeon  
prosessors for \$2499,try building one of them for cheaper,ask Chris Ludwig

if he can build one with the same specs for cheaper. I like Macs because like it  
or not they have software that I use that only runs on a Mac and I can run any  
software that runs on XP on it as well and from were i sit thats makes good sense to me. Now if they come out with a PC version of Aperture and Logic

then I'll get  
a PC. Sure I'd like to run OSX on a PC, but hating Steve Jobs is not going  
to stop me  
from using the software I want. Remember the old saying, "Find the software  
you want to use and pick the platform that supports it" The Mac supports  
both  
platforms.

respect  
Nappy

Nappy. I forgot to put a smiley after my post. I was definitely kiddin' around. Despite my misgivings about Mr. Jobs, I'm seeing some upside to Macs these days. Old habits die hard though and IMHO, Jobs and Gates are cut from the same cloth. I guess that's what irks me the most about Mac....the "pseudo high road" mentality. they are both boxes full of componentry with OS'es that appeal to certain folks, as you said.

Regards,  
;o)

hmmmm.....can you just stop them from running in the background and then reenable them like the Administrative Tools options in windows?

Thanks,

Dej

Let me know how your new  
> build  
> goes for that PARIS box I'll be needing help when I build mine.

I'll keep you guys posted. I decided to use the HD that I was going to be the system drive in my Paris rig today so I need to get another HD. After that I'll finish the build. I'm going to order a Seagate or two for this DAW, I think, and they don't sell them here in the snow covered wilderness. I'll be glad to help when you start your build.

;o)

Ha.. You wish.. I'd be the first to order that "new" version of Logic PC..BUT!!,  
Only if it's a Complete Re-write that has :

- Sample accurate editing..
- Super fast audio editing..
- Killer Mixing graphics.
- tempo conforming incoming audio(Acid. apple loops)
- Hide the environments
- Hide any look of the old tired Logic Audio look..
- Put back VST (still faster than audio units)

:)

Dedric,  
If you add all the software that comes with it and the elegant design plus  
the fact that you can run both OSX and XP and you don't have to build it  
makes  
up for the 90 plus dollars you save. I'm just saying it makes sense for a  
Pro to buy.  
You can do what you want, but you can't deny that it's a good value. I'm not  
a die  
hard Mac person, in fact I'm going to build a PC to run PARIS on, it makes  
more sense.  
PC motherboards still offer PCI slots, and buying an old Mac that boots to  
OS9 is a step backwards. All I'm saying is don't let your feelings about  
Steve Jobs stop you from making a move to a Mac if it gives you more options.  
Let's face it, Thad and James represent two extremes of opinions, I'm talking  
about options as far as  
software goes, yes hardware wise PC's have more options, but as was already  
stated  
they both have the same or some of the same hardware so I give the Mac the  
advantage to Mac for software options. That's my point.

Is saving 90 plus dollars worth it?

respect  
Nappy  
PS please respond

Hey Nappy - first I'm just posting as a friendly comparison of perspectives, not a one is "better" than the other debate, just to be sure you don't misunderstand my intent, or think that I'm trying to degrade the value of a Mac - great systems and nice design on a lot of levels. :-)

The only software I saw in the Apple store config was optional - iLife, etc, and not included in the \$2499. (Bluetooth, etc. also additional). Doesn't

really leave much, if anything different from what comes with Windows XP. Sure, iPhoto, iMovie are nicer than Windows, but I don't use those at all as they are really just home user apps anyway.

Software advantage depends on what you need it for - for Logic, there's no other choice. If it's for home use, or even just buying off the shelf, then preference really has everything to do with it.

I agree on PCI slots, hardware, etc. that's my big reason for staying with PCs, that and they are just easier to use as sample library farms (and multiple PCs also certainly work fine with a Mac/Logic as the main sequencer/host).

Actually for the \$90 saved, I would also be getting higher quality RAM (at least based on what past models have used), possibly a better hard drive, more PCI slots, and more options on the motherboard out of the box, but yeah, it's only really relevant for guys like me that try to get the most out of it for a specific purpose. And yes it is in a pro use where the extra 5-10% can make a difference - even spending an extra \$90 or so I could get 2G which is a minimum for what I do - to add an extra 1G it's an extra \$299 (assuming the buyer would want to go DIY to save \$200).

Of course that doesn't make the Mac any less of a pro solution - it's a great solution.

It's preference - that's all I'm saying. There aren't stark contrasts that often seem to be purported in these threads. For most people it's shades of silicon and grey; but for some users, those shades are much more than a \$90 difference or a half day spent building a system.

Regards,  
Dedric

I agree,they are both from the same cloth. I thought you were kiddin but was'nt sure. Thanks for clearing that up. I use to be afraid of PC's but since owning one I've come to the conclusion that they are just computers. I like OSX a bit better than XP mainly because I know the keyboard shortcuts better. If I could get OSX to run on a PC with to much trouble I would do it in a Heartbeat,if fact when I build my PARIS PC box I'll try and get it to boot into OSX. Let me know how your new build goes for that PARIS box I'll be needing help when I build mine.

The only software that runs in the back ground is DashBoard, and you can disable it, or completely remove it. But I don't think it's much of a hit on the system.

I'm still not sure why you think Mac OSX is bloated? I'm not sure why you think the first thing you would have to do is get under the hood and start ripping things out??? To me it would be like you getting a new 600 hp. Dodge Viper, and the first thing you want to do is rip out the AC system and passenger seat to make it faster, when all your going to do is drive it on the street. I would use a Mac out of the box for 6 months and worry about optimizing it later. However, if you want to hot rod a Mac, this is one of the sites.

<http://www.xlr8yourmac.com/>

Some of what you call bloat, like GarageBand you might find useful for song writing. Until you use it for a while, you won't know. Your thinking that you need a dedicated optimize audio work station, and that's Ok, but with a Mac you really can use it for everything without it being a problem. I guess it's a different line of thinking.

Honestly, I think it could be a bit of a hard transition for a hard core PC user. I think at first, nothing will be where you want it to be. I think it would be like being dropped off in a huge city you never been in. A place where they drive on the opocit side of the street and nobody speaks your language. It is to some extent like a whole different world. You'd have the basics down in an hour or two. After a year of honest effort, you will either hate it, or be totally hook. Either way, you'll truly know if a Mac is for you.

I'm not telling you to get a Mac, I think if you do, you will miss all your PC tinkering. Then again, I know you'll find away.

OK.that's great!!

>  
> I'm still not sure why you think Mac OSX is bloated?

Because it's got so much stuff bundled with it that it totally unnecessary  
for my needs.

I'm not sure why you  
> think the first thing you would have to do is get under the hood and start  
> ripping things out???

I just have to do this. I don't even know why anymore. ;o)

To me it would be like you getting a new 600 hp. Dodge  
> Viper, and the first thing you want to do is rip out the AC system and  
> passenger  
> seat to make it faster, when all your going to do is drive it on the  
> street.

But I'm not driving it on the street. My office computer is my street

machine and it's got tons of crap on it that I'd never want on a DAW.

Yeah. I'm familiar with that site. I used to read Thad's articles there.

Definitely different and no offense, but this goes to the root of my  
misgivings about Macs. There have been so many outright lies told by Apple  
vis-a-vis performance that the company has no credibility (with me at  
least). Plus, I don't like the little smartass on their commercials.  
;o)

I know. I own a Mac now. My wife uses it. I just give it sidelong dirty  
looks whenever I'm in it's presence and it's always \*\*\*\*'ing up.

You'd have  
> the basics down in an hour or two. After a year of honest effort, you

Yes, it would definitely get \*personalized\* before too long.  
;o)

Hey Nappy -

We all debate these things as if they really matter, but it's just a means to an end. Macs are great systems - the best comp is the one that serves you best.

>

> PS how are the kids? You do have 2 if I recall?

> I remember when your first was born.

We do - thanks for asking. They are doing great! Aidan is 6 and in kindergarten, and Bren is 19 months - both are a lot of fun - sweet kids. How's your family? How are you?

Regards,  
Dedric

Understood!

I'm not as computer savvy as most here which factors into my decision to go with a Mac. I agree, preference is everything.

PS how are the kids? You do have 2 if I recall?  
I remember when your first was born.

That has zero to do with what I posted originally. My point was that I have heard for YEARS that Apple somehow uses these super high grade components that make their hardware more expensive. I haven't had to set up a Mac in a few years, and of course the PowerPC versions were comparatively opaque unless I would go to the trouble of putting Yellow Dog on them. Which I didn't. But, because a co-workers' kid wanted to play a Windows game on his Macbook I had a chance to look at what kind of hardware is in a \$1400 Apple laptop. The answer is pretty much the same stuff that's in a \$750 Dell laptop, give or take a copy of iLife and a web cam on the Mac and a bigger screen on the Dell.

There are plenty of arguments for owning a Mac, the biggest one being personal preference. I was only seeking to put another of them to bed, that they use bending end components that put their hardware in another class than what I use. Quite simply, they don't, and the move to generic Intel hardware makes that quite clear.

Hey Deej!

Be careful, some of those demo machines are FUBARed! Some people actually try to hack and sabotage them. Or is that your purpose? ; )

On your PC you have a good cognitive map of where every thing is and how it works. Like I said, Mac OSX will be like being dropped off in a strange city. A good way to get a better understanding of Mac OSX is to read all the info here:

<http://www.apple.com/support/mac101/>

I know this is going to sound obvious or elementary, but another good source of information is under the help menu in OSX. Just type in a keyword or short question, but start with the mac101 first.

After you go through mac101, then check this out.

<http://www.apple.com/support/switch101/>

I think that Apple will release the Core 2 Quad 8 processor machine in the next 3 to 4 months. By July for sure. I would wait to buy, if that's what your thinking. Their release schedule is all different now with the Intel chips???

Well.....as we were discussing, I need to see how much of the existing OS  
I can hack, right? I figured I'd have some fun on someone else's machine.  
;oD

Dedic,  
From Newegg.com, dual 2.66 Xeon Gigabyte server motherboard,

Is this board Dual 2 core (Xeon) compatible??
