Chuck,

I don't know diddly about this coding stuff, but this is something I dug up last week.

<http://dssi.sourceforge.net/why-use.html>

If it helps, then good on ya. Your efforts are much appreciated.

;o)

Guys,

Found lots of bits and pieces of what I want to do.

The most interesting find was a 64 X 64 virtual WDM driver. Source is available (not sure how much \$), and it wraps up nicely with ASIO4ALL, at very low latency. Honestly this is huge, if it pans out I will post some test packages so we can test it between things like cubase and wavelab. This would give us the base of 64 ASIO virtual ins/outs, the hardest part of the entire project.

So the next items to tackle:

1. See if I can find source for a single channel asio compliant VST/VSTI host. This would be expanded to 32 channels, with latency compensation.
2. See if I can find source for a VST plugin that is also an asio client.

Chuck

Dear Chuck,

I have the code of a vst chainer plugin will that help ?

It is called vst multifix.

It has though some 16 bit versus 24 bit bug ,but not sure ...

Regards,

Dimitrios

Sounds awesom Chuck.
Rock on!
