Apple announced a new Intel based iMac that is 2 to 3 times faster than the G5 iMac. The one more thing, was the announcement of a new lap top 15.3" screen, that is 5 to 6 tomes faster than the current PowerBook. Pro app. will be available for the new Intel Macs in March. The upgrades will be \$49.00.

Wow!! So, it finnaly happend!!

I sold my G4 last year because it was just too slow for my VSti modern recording studio needs. Tok the money, and got a nice speedy PC.. Now, I'm Mac excited!!!

However, as excited as I am for Apple and it's new Macs, I'm wondering if it's too late to the Party?

This move proves all they ney sayers and Mac loverswrong in the speed arguments over the years. Even worse is when Apple purchases

Over the years the processors from Apple, intel and AMD have all leapfrogged each other in speed at times. It's like a feature in a sequencer software package, somebody comes out with a new feature, and six months later every body else catches up. It will always be this way.

The need for speed will always drive us, but it's not the whole story, ease

of use, usefulness, and productivity are more important.

You have to look at what they are really saying. The Power book with its G4 processor is a Pentium III era processor. Saying that a new lap top with two new generation Intel dual core 1.8 MHz processors, faster memory and faster bussing, is 4x faster than a single 1.6 MHz G4 power book, shouldn't surprise anybody.

The thing that bums me out is, they kept their price structure, which means higher profits for Apple per unit, but smaller market share. And no new computer for me for awhile

I'll wait for the iBook and Mac mini, should be April, or May. Hopefully the pricing will be a lot better.

The thing that people should be excited about is the ability to run what ever software you want on one machine. This way the hardware does not restrict you. Or as my sister, the holder of a masters in computer science once said, " I don't care what hardware I use, as long as it doesn't get in the way of the software!"

I think it's a good start.

Hi James,

I would agree with you, but me and other PC zealots having been taking the Apple "marketing" machine down our throats for years. I mean (Apple)just pain O'll lying about it's processor prowess during those keynotes from Mr Jobs. I'm a Comp/Sci grad who works (day gig) as a SeniorLevel GroupWare Consultant. I have and still maintain all types of CPU harware since 1986..I have to say that while the mac os is nice, the processing power was always lacking behind intel & amd. But Apple spewing that "we have the fastest machines" and pc's were a distant second.

As a fomer mac owner, I always feft I was getting shafted and just buying 'hype'. looking back, Mr jobs has to recognised as thee biggest snake oil salesman ever to walk this earth..

Now, all bets are off. Why should anyone purchase a new Mac? When you can buy the same intel machine a proven os that doesnot require devolpers to rewrite code from scratch ie:(plugins).. Most speculators say that it will take most mac developers at 2-3 years to to have a mac/intel compatible apps and plugins..I hope that they are wrong..
Best..Lamont

>>>>This move proves all they ney sayer's and Mac loverswrong in the speed

machines are native. There are already some third party apps. that are native now. MS made a five year plus commitment, and stated that their apps will be native soon.

The speed, well, I know that independent labs tested the Macs with industry testing software and used industry testing standards in the past. I believe those results were true at the time, however those results didn't stand for long. There is constant speed development in the PC world. I guess it's a matter of beliefs, so there is no sense in debating it.

I'm sure the next argument will be, that a machine that is running Windows, runs software faster than the Mac running the same software. It will never end.

The biggest problems with the new Mactel machines is the price.

The best thing to come out of MacWorld to day for me was the iLife apps. and iWork. GarageBand is cool song writing software. It is a little weird, but it's the closest thing to a quick song writing scratch pad to get ideas down with. I think most of us would agree that we all need something like that,

If you got QT and you have the time, You should check out the keynote speech.

By the way, you PC Zealots that hate Apple no matter what, are going to really hate Apple when you see the new Apple Intel TV commercial;)

I wonder if they are going to play it during the Super Bowl???

Check it out, they played it not once, but twice during the Keynote!

Hi James,

No, you understood correctly concerning the \$49.00 upgrade price. The prices listed in the link below refer to upgrades to Final Cut Studio from other Apple video software.

-Michele Hobbs

They demoed MS Word and Adobe Photoshop running on the intel macs today using Rosetta. Jobs said the upgrades for the pro apps. would be \$49.00, but I may have misunderstood what he was saying. Check out the Keynote speech for yourself.

I just double checked my info, according the Steve Jobs, they have a crossgrade program, were you trade in your pro disc for the new universal ones and the cost is just \$49.00. You must have the latest version of the program to do the crossgrade for \$49.00. Up grading older versions will probably cost more. The applications he named were, FCP pro, Logic Pro and aperture.

Damn thing wont play on Quicktime Alternative...

....if they think I'm loading the QT virus on my machine they've got another thing coming. ;o)

Cheers,
Kim.
