Vehwee interwesting. Not too surprising -until apps are optimized for Vista
it seems best to stick with xp32 or 64.
MR

Interesting as well, is that Digidesign has their 7.4 Pro Tools Vista ready!!.
I guess there's some perks in having MS\$ as Advids biggest investor.

I really want to see and hear the RME's, Motus, Steinberg's lame excuses as to why they can't deliver the goods on Vista.

Either they get their vista acts together (soon), or lose even more ground to Digi and Apple..

[View Forum Message](#) <> [Reply to Message](#)

You might want to read the SOS article on Vista from a couple of months ago. RME was less than enthusiastic about Vista.

Cubase and Nuendo 4.1 are Vista compatible now, and a 64-bit version is out as well.

Vista isn't their fault, it's Microsoft's. It sucks imho, and never will be a great audio app unless it's overhauled or stripped back down to being XP SP3.

German Keys magazine and a few Nuendo users that have tried it, are reporting that Nuendo runs better under bootcamp XP than OSX on the same mac (new core 2 systems), same projects requiring higher latency to run under OSX than bootcamp XP, at least in one case. Not sure how much difference there was in the Keys mag tests.

Seems like XP is the most effective OS for audio at the moment. Not that there is anything good about OSs being significantly different in performance. These are just supposed to be operation systems, nothing more.

Regards,
Dedric

Sorry, Lamont, this is not a developer problem, it's an OS vendor problem. And it supports what I've been saying all along, you'll take a performance hit if you want to use a 64 bit (integer, FP has been more than 64 bit for years) OS, at least for now. The only reason to use a 64 bit OS has nothing to do with 64 bits, it will have to do with things like better multithreading support and such.

Don't, don't, don't . . . don't believe the hype.

Hey Dedic, I saw that article from SOS (Remember the thread I start because of it). I don't buut. RME and the others need to get off their asses a nd just give in to Apple & MS\$, or get left behind. It's that simple. Or, stop whining and come out withtheir own OS..

Thad, I'm not beating the 64bit drums, only the OS drums. If some Pro Audio vendors have vista working on their new DAWs, then the Audio interface manufacturers needs to be in lock step.

After reading what RME stated in that article makes me not what to purchase any more of their products.

LaMont, please don't take this personally, but you just don't know what you're talking about. I know the RME guys. I was there the first year they were at the Frankfurt Musikmesse. They are one of a very small group of companies that do all of their driver development in house. And they do better than anyone in the business.

Drivers are extremely arcane pieces of software, it's uber geeky stuff. People talk about 'why can't I use any motherboard I want' when driver guys know things like 'on this implementation of this chipset if I don't wait 15 milliseconds before doing X then Y device is going to completely blow up and I'll panic the kernel or the mouse won't work without a reboot.' Which is why good driver guys are booked years in advance sometimes. RME does this all on their own and their first Mac driver was the most solid Mac driver I ever saw. They're the best there is, they even support linux. If they're not writing Vista drivers it's because they can't or don't think they can provide the quality they want for their products. It takes a special kind of company to say, 'I won't let down someone who pays good money for my stuff because the OS too much of a moving target for me to write a really good driver for it.' That's not sloth, and RME aren't lazy, they're German fer chrissakes.

M\$oft has some work to do on this.

Good essay, Thad... I like RME, and have had only ONE issue with any of their drivers, and it was a version they updated/corrected shortly thereafter.

And their convertors fail to suck, as well - in my book, anyway.

Subject: Re: DAW Benchmarks for XP32, 64 and Vista..Pro Tools 7.4 Vista
Posted by [Dedric Terry](#) on Tue, 13 Nov 2007 03:24:54 GMT
[View Forum Message](#) <> [Reply to Message](#)

Lamont - they already did:

[http://www.rme-audio.de/en_downloads.php?page=content/downlo ads/en_downloads_driver&subpage=content/downloads/en_downloads_driver_hd spe](http://www.rme-audio.de/en_downloads.php?page=content/downlo%20ads/en_downloads_driver&subpage=content/downloads/en_downloads_driver_hd%20spe)

(See the Vista 32/64 support listing)

The issue isn't that they can't write drivers for Vista - they did,

Nuendo/Cubase are Vista compatible, etc. It's that Vista isn't as efficient at low latency with any drivers - RME, Lynx, etc. Check the dawbench.com Vista vs. Xp performance reports.

Working, and working as effectively as it is on XP32, are two different things.

What is pro audio to do? Hmm... a trip to Redmond?... hehe....

You are exactly right from the consumer standpoint - we are in a bit of a pickle at the moment. Audio developers haven't been dragging their feet - there have been issues at the OS level, with OSX and Vista they had to wait for a final decision on before jumping into this. Maybe MS will surprise us and release a really efficient SP1 for Vista, but imho, it would take 4 years to strip the security crap out first. ;-)

Hey Thad, I'd be the first to say that I don't have the expertise in Drivers. :) But, somethings gotta give. If Digi and Cakewalk can do it, why can't RME?

I'm taking off my tech cap, and approaching this from a purely consumer standpoint. MS\$ is going full- tilt with Vista. No turning back. So, what do the Pro Audio market do?

The Pro Audio market should say to M\$oft: "This sucks - it's total bloatware & will not allow either of our audio client bases to put their rigs through the heinous shit they need to do on a day-to-day basis in order to make use of a PC for audio - you guys in Redmond need to come up with stripped-down version of what USED to be WinXP, geared towards the millions of audio users out there, and then we'll talk. Otherwise, you can kiss this whole market segment goodbye, and just cede it to Apple."

That's what they should do.

Neil

I've had Sonar 6 and 7 on both Vista 32 and 64 and PT LE on vista 32. Neither are performing even close to XP. Until MS corrects things to at least get performance on par with XP it is a waste of time and money for any professional to invest in Vista at this point. RME are one of the few being honest in the article.

MS is released Vista before even basic component drivers were fully compatible. Most of the common ones still aren't. ATI and Nvidia are still having trouble getting driver solid. Creative Lab are having trouble getting their cards working. Many reports of printer drivers not working right. Many SATA, SCSI and SAS devices not working right. These are some of the many reasons even the main stream business market hasn't has not gotten completely behind Vista. The only people on the Vista band wagon are consumer types that weren't given the choice by the Larger PC makers. But even enough of them demanded XP that MS allowed XP to be offered longer. XP would have been out for the market by the end of this year other wise. When Major PC makers start having people say I want XP on it or I'm not buying it they are gonna make MS offer it.

RME _is_ doing what they can, but it's not their fault that M\$oft doesn't (and probably can't) spend any significant time worrying about pro audio. So they release Vista with an unfinished, poorly documented audio hardware spec and (really good) companies like RME do the best they can. And they

tell the truth about the problems they are having.

As a consumer you make like Adam Smith and do whatever you think is best for you. I try to provide some color about the technical issues behind this stuff for people who don't read the lkml for fun. For me, I'd guess I'll look at Vista right about the time I can justify a dual quad core audio box.

Good points (Dedric & Neil).. Maybe the whole lowtency thing is over. Just use a mixer, any mixer is the approach from here on out..
