Something like a DL380 with 2 Go xeon CPU, 4 Go ram, hardware raid controllers, 4\*36 SCSI Go drives, LTO drive for backup, 5 PCI slots ==> it can be found from 0 to 150\$. Parts are standard, but get a spare server, and you can host paris for years to come.

- Performance are certainly not top notch but i personally don't care for fancy plug in (still prefer analog for EQ & comps).
- Reliability & security will be top notch : RAID 1 or 5 or 10 + real backup policy, and archive a LTO tape from time to time in another place.

...provide you have a separate room, cause those beasts are noisy. a lot more than a mec.

Is there someone who can share his experience with this ?
