Hi,
I am having some eds card problem here and I would like to eliminate the
power supply factor which is a good one by the way and only 1 year and a
half old.
Is there any program that can run and test the voltages when Paris is running
full data ?
Regards,
Dimitrios

I know that my home PC has software on it for checking the power supply's
output. It came from the vendor of the motherboard (in my case, Asus). I'm
not at home now, so I can't tell the exact name of the software tool... but
check the web site for <whoever-makes-your-main-board>.

Thanks !
I now remembered I had this one from Asus is called Probe !
Yes and it came with the install CD of the motherboard (P2B)
Thanks again for reminding !!

Regards,
Dimitrios

One of the PC magazines recently recommended a program called SPEED
FAN. I am running it now and it works very well. I have a similar
utility that my motherboard maker included, but this seems a bit more
flexible and powerful.
