Subject: Config file weirdness.

Hi all.
So far it's been pretty smooth sailing with Paris 3 running under win7 64 bit.
I started a mix session tonight, using a favourite string of older native plugins on inserts, and I had a random crash on exit. (Fortunately I saved prior to exiting, as these plugs caused issues in the past when I was running XP, and I know I have to save often).
But this time was different. Upon relaunching Paris after a reboot, Paris refused to load, with an error message something like: "Missing Cache File".
I checked the Paris.cfg file in the folder where Paris is installed, and it was completely blank!
No biggie, as I had a backup of the file named Paris.cfg.backup,(which I had made whilst installing Paris on my new box), and renamed it Paris.cfg. All is well again.
I then made another backup in case this happens again.
No Biggie, just thought I'd share this in case this happens to you guys. Always have a backup, especially if you have tweaked your cfg file to perfection.
Cheers,
Kim
