Can I run 3 EDS 1000's with a MAC G3 and will it work well if the computer is dedicated strictly to and for Paris use.

Also, I read this on [www.parisfaqs.com](http://www.parisfaqs.com), (see below) is this saying that indeed it is possible to run Paris on a G5 with a Magma or SBS chassis and if this is being done, how well is it working for Paris users?

Macintosh G5 computers and Paris

The EDS-1000 cards are 5v PCI boards that operate at 33 MHz on a standard PCI bus, with a 32 bit data path. That means that the EDS cards will NOT work in the new G5. However, you can use a Magma or SBS chassis and put your EDS cards in that.

The larger issue is will a G5 run OS 9.22 or older. Paris no worky on OSx of any flavor.

G5's will not run any version of OS9 native and so will not work for Paris.

Sorry.
