Anyone have any experience w/ these? I'm thinking about picking up a used one for doing remote recording. It has direct analog outs and ADAT outs but if I run the 24 bit outs of the Digimax into Paris' ADAT card I'll lose 4 bits. Do you think anyone will notice? I could also just run the direct outs into Paris' AD converters...

Gantt

OT to your question, but..

Not sure I follow why you would lose 4 bits...ADAT is ADAT, and to the best of my knowledge there are no ADDA convertors that go above 24 bit...can you elaborate on how/where you would lose bit information?

FYI: 20bit recordings have a dynamic range around 106 db or so...far greater than CDs, tape, etc, so the only one who would really notice would be you, and then only if you looked at your bit metering....

To answer your other question, I have used a Digimax a time or two, and was not overly impressed nor overly disappointed...they don't shine, but they don't suck too badly either. I would guess if someone is essentially giving

it away for a stupid cheap price, buy it - if it doesn't work out, sell it to a live sound company using only Mackie or B***inger stuff.

The Paris ADAT cards only pass 20 bits. Trying to send 24 bits thru them would truncate each digital word to 20 bits. The question is whether or not the low level info that lives in the least significant 4 bits is noticeably to anyone besides newborn children and dogs (none of whom would probably care!).

So how does it compare, for example, w/ Mackie mic preamps? My usual remote mic pre is my old Mackie 1202 (pre VLZ).

Gantt,

I got the non firewire presonus Digimax.
I purposely got the non because there was much talk of
major bugs with the FS. Drivers weren't allowing complete
utilization and many bugs.
I can't remember exactl, but I didn't like what I heard.
They may have fixed the issues by now I don't know.
I am sure you can find a forum somewhere that is discussing it.
Sorry couldn't be more informative.
I haven't had a problem with my Presonus.
Works fine.
Clocks to the MOTU 8pre via lightpipe no prob.

Brandon

It will work fine... You probably won't notice anything missing as
the dynamic range of the best coverters is roughly equal to 20 bits of
resolution.

David.

I assisted on a remote recording a few weeks ago from the band Keene. The truck had 4 or 5 Digimax and one RME Midi Controlled 8 channel nit.

I was pretty impressed by the play back I heard, the engineer seemed to think they were pretty hearty for mobile use. One did go was not getting signal before sound check, so we popped it open and saw a small ribbon cable had come loose! he plugged it back in and was good to go.

Thanks...being of the unclean (not a Paris user) I did not know that...

As others have said, they aren't Neves or Quad8s, but they ain't bad...if the price is right jump on it

Um not to hijack, but there is a guy at GSselling a racked set of 8 original qhad channels with EQ for around six grand.....oh man....I am chomping at the bit,,,,,

Anyone here tried the A design Pacifica or the P1?

A guy I know has (or had) one of the earlier ones. His opinion

was basically: "they're OK, but they don't have much headroom".
He didn't say it sounded bad or anything like that.

So, depends on what you need, I guess.

Paris adat is 20 bits passing only.

Yes...I have, use, and endorse both...IMO the ADesigns stuff is the most versatile and colored with a pleasing bouquet of anything else I've used, including Neves, API, ADL, Millenia, etc..

I would not hesitate to (and have done so a time or two) use exclusively the Pacifica and P1s for an entire CD project.

I haven't used one of these, but I believe it just got a rave review in Tape Op. Evidently a great improvement on the previous model.

Do you hear much of a downgrade using the p1 as opposed to the pacifica?

Not at all...although there are minor differences in sonic response based primarily in the physical limitations of space and transformer size, both are top notch, and both have been used interchangeably here. The Pacifica IMO ekes out in sheer sonic power, while the P1 is more a finesse piece - if that makes any sense

Thanks! I need to decide what to put in my last two slots, although I seem to be having issues with the pres in slot one and two all of a sudden, I need to hunt down the culprit, could be a bad snake. I hope it was just a ghost.

Anyway, I was thinking the A Designs would be great for overheads, vocals acoustic git that sort of thing.

Yeah my 8 pre is the basis of my system.
I haven't had any real issues with it.
I use the Presonus as a preamp 8 channel extension lightpiped and slaved
to the 8pre. I rarely use the 8pre ins since they are located on the =
back and=20
less easy to get to.
Presonus is better designed for lazy people like me.

--=20
Thanks,

Brandon=20

"Neil" <IUOIU@OIU.com> wrote in message news:46716569\$1@linux...

Although not ever having used any of the Presonus stuff before,
I would kind of tend to agree with Crhis' last statement - at
least from a standpoint of HAVING used RME & MOTU stuff.

I've always been happy with the sound & performance of my RME
Multifaces, and I recently picked up a MOTU 8-Pre, and although
I'm not using it as an interface, so I can't speak for the
drivers (I just using it as a stand-alone preamp for tom mics
so far, lightpiping the signals out to one of the Multifaces),
I can say that for \$549, it's a bargain for a bank of eight of

what so far seem to be pretty darn decent, good clean preamps.
