Ok, I try-ed to get some recording done tonight on the Mec(B)  
I send a signal to input #1 and #2. I set up the patch bay the same way i did Mec(A). Mec(A) works fine but not Mec(B).

So what's up with this now. Im sure it's something I'm not doing right. Looks like to me you have to map out each Mec by it's self and then they (the Mec's) just buss together at the end to the Master buss. Is this right?

So what I'm I not doing here. So the (Mec B) has green LED on the input cards showing signal. I just don't have a response when I hit the record light. Bye the way the record light do work and also on the C-16. Maybe something in the patch bay but not sure. I am still reading the book but have not seen anything as of yet to render a fix. Helllllllllp !!!

cheers,

Jeff

Not like a 2" recorder, you don't always know if the computer is broke or it's just toying with you....

Can you drag some audio files onto the card the mec is on and does it play audio? Have you double clicked on the inputs for MEC B to make sure the correct modules you are using for inputs are indeed the ones for the correct channels. I have had where the Adat card was showing on like channels 1-8 instead of the input card and had to move the input card up or from the selections on the right.

.....wow I type from Italy and it gives me an Italy flag!

Hi Jeff, just a couple things to eliminate;

1. You do have a BNC cable from the primary MEC clock out to the secondary Mec clock in?
2. The little ribbon cables from one EDS card to the other are all in place properly?
