ok folks I am gonna try to keep this thread to one simple question. Is anyone using XP64 with Paris with success? Has anyone tried?

I took the time (LOTS of time) to weed through the search and see if this has been brought up at all. The only one I see that is relevant is a recent post by drfrankencopter. But everyone answered his questions except that one. Perhaps no one knows. At least that would be a valid answer... Because I am about to find out!

I moved away from Paris and onto a XP64, Gigabyte AMDX2 4GB motherboard, firewire / Reaper system using UAD-2 Nevana. Great sonics and rock solid!

However, I didn't think it would ever happen, but I am now in need to pull up some old Paris projects from early 2000 and 2001 that is archived on discs that I want to remaster. Unfortunately it is just not the same to convert the .paf files and bring them into Reaper because I had tweaked specific EDS DSP effects that can't be re-produced in anything known to man! lol.

I did purchase Mike's new drivers, so I am gonna install an EDS card in my current system and see if I can get Paris working in XP64. Hopefully it works and I'll report back with the results if anyone is interested.

By the way, I have to honestly admit... move to 64bit OS when you can. Just awesome for speed! I did run into a few driver issues. But none of them were show stoppers. If you're planning a future system, consider 64 bit. Hopefully after Windows 7 is released more vendors will consider better 64bit support!
