I hear subtle improvements at 96 for small ensemble acoustic recordings.

mic pair on a string quartet or a small folk group. By the time you convert back to 44.1, any real improvement is modest, but the original 96 masters are definitely superior.

Where I here a dramatic improvement with 96 (or other high sample rates) is when I use plugins. HydraTone is way better at 96 and starts to sound like high-end analog equipment. Others like the Sony Oxford plugs, or the TC VSS3 reverb running on Powercore also benefit dramatically. This is frequently not subtle at all. Another place where the change is dramatic is with some soft synths like FM7, which sounds far better at 96 (this is not true of all synths).

I have been playing around with hybridized Paris setups that include some 96 with mixed results.

96 files, then do batch conversion to 44.1 using Barbabatch and run the 44.1 files from DP through Paris or transfer the files and mix in Paris.

This is a lot of work but definitely adds depth and sheen to the final mix

despite the extra conversion.

The quality of your conversion will make-or-break this concept. Barbabatch

ling line level signals). How does this stack up to the Gold
Mic?

Also, is there any reason (e.g. impedance) you couldn't feed the Gold Mic's
mic level signals with a line level (set low) and the mic gain to 0 or 1?
I like the idea of being able to feed line signals (effected electric guitars,
etc) to the Gold Mic (flair function, etc).

I figure I'm probably not going to see a significant improvement on my Spirit
Ultramic pres on toms and snares if I went for the RME Octapre / QuadPre
or Focusrite Octopre, and would rather have one high quality dual channel
tube pre I can use on acoustic gtrs / vocals than lots of lesser quality
pres (Octopre LE).

Advice greatly appreciated... Taking the plunge soon (probably tomorrow).

Cheers,

D

"Dave(EK

Are many Paris only guys using 48 all the time? is the slight difference
worth it if there is going to be file conversion?

>I think boards rarely go up in the immediate future. Usually the first 10
years is a hard time for a keyboard's price, but after 20 years or so often
they start to hit back. For example I know the Roland Juno keyboards, in
Australia in the early 90's they were going for \$350-\$400. These days however,
I spent \$700 on a Juno-60 just recently, and most people think I got a pretty
good deal with it.

I was talking to a keyboard player on Saturday night who played Wurlizters.
He said he bought his first one in about 87 for \$200, then another in 95
for \$1600, and one just recently for \$2500 or something.

The big question is whether or not a given board will fall into that bracket
where, ten years later, people will realise that it has something that no
other keyboard does, and I have a feeling this one will...

....I sent you an email with specifics of why. :o)

Cheers,
Kim.

Well aint that the truth! Mind you a DAC-1 is more like \$1500 in these parts,
or more even I beleive. I'm told I can get one for a little under \$1500 I
think I was told.

And I'm planning to sell the amp and stand which come with the keyboard,
so hopefully I'll only have to outlay \$6-700 for the keyboard all up, which
is only half the price of the DAC-1...

....and honestly, you have no idea how much I hate having to set th keyboard
back up after a gig/rehearsal, nor how much I love to play the things. ;o)
