Just finished tracking a punk band. we just went balls to the wall 10 drum mics, Bass DI'ed and Mic'ed, Lead guitar cab stereo mic'ed with a POD DI, rythm guitar stereo mic'ed and a scratch vocal. We didn't stop to create a new song each time. I just "rolled disk" and tracked 12 songs back to back.

Now I've got to split them into separate tracks and render each one individually.

This sucks.

One thing that didn't suck though was tracking the drums and bass on a pair of Multifacia on my slave comp while tracking vox and guitars on the master machine.

Neither comp was breathing hard at all and Systemlink worked like a dream.

Well, I'm still trying to put together some kind of scenario wherein I can do everyrthing I always dreamed...easily. It's the easily part that is a bit up in the air but that's more an issue with my thinking vs Steinberg's thinking than anything else. I've got my head around the Totalmix program pretty well and I've got 16 AD/DA's on the slave and 18 AD/DA's on the master machine and I've got the slave loaded up with VSTi's that I can stream to the master DAW over 18 mono tracks (if need be so I can process the tracks with my UAD-1 cards on the master DAW) plus the main stereo bus from the slave is being input to the master. It's opening up some possibilities that I haven't had much time to explore yet.

I've built some templates in Cubase that are making things a bit quicker to configure a tracking or mix project.

Good job!! it's funny that Acid has the "Save as >Render> all tracks as "Separate Files" feature, ANd most so called Pro DAWs don't..

I have to use this plugin <http://www.silverspike.com/?Products:Tapelt>

Work like a charm, and for 20 bucks it does save time for rendering tracks..

Questions:

1.) Why did you feel the need for a slave comp? I'm tracking bands at 88.2k/24 bit with more than this many tracks at once, using two Multifascia, on one PC that's got less horsepower than yours (as I recall), with no issues.

2.) I noticed in your reply to Rod that you said you had set up some tracking templates that made things easier... did any of the templates that i sent you awhile back help at all?

Oh yeah, I've NOTICED that!:-) (and I'm still running Acid twopointfreakinooh.) Live doesn't do it, Cubase SE doesn't do it. I'm guessing your observation means Logic and PT won't either. Sonar? I'll have to check Reaper. Fact is, this sort of feature makes it easy to keep Paris in the workflow. Render each track as a batch process, import via Analog X's program and you're there.

for multiple export you need meap.
<http://www.pendlebury.biz/index.php?categoryid=22>

I don't know if it works in 4.1 though.

Also, don't put all your songs in one project. That is suicide.

Make a project. Record the first song for the punks. Then save it. Then do save as new project called Temp to a new folder.

Then close everything and open that project. Then delete all events on the playing field and in the pool select "Remove Unused Media" then "Empty Trash".

File / Save as Template and call it Punkies. Now you have a template for each new project. Backup project files and the entire project too. Project files do get corrupt sometimes. this way you'll have a good backup and each song in a new folder.

DJ, please tell me you at least have separate audio files for each take?
If you just kept it in record for all songs back to back as one long

file, you are living really close to the edge, brother. If you got a corruption in an audio file or a crash, the whole session could be out the window.

OTOH, if you did do separate files for each song, you can simply delete the tracks you don't want and save the song, then undo the deletes and do the same with the next one, etc.

that's what I wanted to do but the band didn't want to do it. these guys wanted to just go full out-song to song. They are a very "vibe oriented" group and once they got the "vibe" going, stopping to reload a new song each time was not really an option.

Not a problem really. LaMont and Neil seem to have found solutions to this. I feel like it's my job to make the tools I have here work in a way that accommodates the needs of the client.....even if it means making software perform unnatural acts.

I have two backups of the entire project..... something like 1GB each.
They are on two separate 750GB hard drives that I use for backups.

So LaMont,

If I drop one of these as a plugin on each track, I can set a destination folder, play the track from POB to POE and it will render new .wav files to the destination folder which I can then import into a new project????

Thanks,

Deej

DJ - you can use the record to track function in 4.1 to do this. I can't recall if audio tracks can be sources for new audio tracks, but I think they can - if not, just make a group for each track and then create however many new tracks you need, assign those groups as inputs for the new tracks, set your range for each song and record them (set the record folder to a new folder for each song if you want).

Dedric

Hi Neil,

Some of this has to do with the actual physical I/O limitations of a MADI card and the way I am interfacing my outboard hardware. the explanation would make your head hurt ...but the other (main) reason I have things set up this way is to use the slave machine for VSTi's or video while using the master for audio. I'm going to be composing music for videos here shortly and I'm needing to make sure I've got a dedicated comp for it. Also, for working with VSTi's, when BFD2 is released, I'll have 18 separate mono (or whatever combination of stereo) tracks that I can stream digitally from

slave (running BFD) to Master (running my 4 x UAD1 cards).

Tracking this project to two comps was more of an experimet than anything else, just to see if it would work. I had a template set up on the master machine that would have been easy to switch to had this turned into a cluster****. It was pretty cool to do it this way. I think I coul have probably tracked all 18 tracks at 1.5ms latency without ASIO direct monitoring with no problem. They're coming back in here at 2:00 for dubs and I may try this as a quick experiment just to see (if they all show-the bassist doesn't need to come back so he may not show).

Unfortunately, a couple of months back I had a major crash of the system drive that had your tracking templates on it and wasn't able to recover those (and a lot of other stuff ;o(.

Subject: Now low latency recording using master/slave

Posted by DJ on Sun, 04 Nov 2007 18:40:24 GMT

[View Forum Message](#) <> [Reply to Message](#)

Actually,

Since the session is still set up with all of the live mics, I just fired up all the preamps, turned off ASIO Direct Monitoring and set the buffers to 32k (1.5 ms, which is actually 3ms due to some terminology voodoo that RME has going on-they implement a 32k buffer within the hardware that is not adjustable so when the control panel states that you are set to 32k, you are already dealing with a 32k pre-buffer..but anyway). On the slave project, I had Ivory VST, Halion, Garritan Personal Orchestra, BFD and a couple of synths set up and loaded as part of it's default. When recording 12 tracks at 32k, my CPU was running at about 35-40% but I was getting occasional spikes. After unloading the VSTi's both machines were using about 15% CPU-12 tracks being recorded on the slave and 8 tracks being recorded on the master.

This is at 44.1. Once this session is done, before I break everything down, I'll set this stuff up on an 88.2 project and give it a run for the money.

I
'm still not too crazy about the audible latency at 3 (actual) ms. It sounds phasey to me when compared to ADM.

;o)

you need a snap server dude, or a SAN, or maybe even Windows Home Server.

I did a save after the end of every song.....then started rolling again.

John,

I get your drift, but sometimes band sessions tend to take on a life of their own once a flow is established. Every session is different, but once a momentum is happening, I don't like to interject myself into the equation. I just want to capture what's being played. The best stuff happens when a band is able to forget they are in a studio and they just lock up and go for it. If this causes me a bit of hassle, well, I consider it my job to learn how to solve these issues in a timely way once the music is tracked. I learned a lot last night and today about this system and how to get out of it what I want and I always appreciate your advice. You really have your head around

the functionality of Cubase much better than I do. When I'm tracking a full band though, I really don't like to try to control the musicians when they are on a roll. I try to get out of the way and deal with the fallout later (and I know.....I bitch and moan a lot ;o)

Deej

don't you have enough problems? make separate projects. They take 10 seconds to make from a template. Otherwise I'll have to come out to Colorado and straighten you out.

Deej,
Make 20 folders (2-3 minute songs right?) before session with the =
template already there.
Name them later. Open hit record go, save . Next.
Tom

Actually.... looking at 2 of them sync'd for backup. Did a recording of
"Rain" at a local theatre a few weeks back(<http://www.annerin.com/rain/>
)... 46 tracks of 88.2/24 onto PTHD. Used 2 HD24's for backup and they
worked great.

David.

1. Record the whole thing as one take, in one project.

2. Afterwards drop locator points between songs. Cut across all tracks at the locator points.

3. Save the project using save as, once for each each song in the project.
4. Open individually named song named projects one at a time, delete all regions to the left of the song for this named project. Delete all regions to the right of the end of the song for this named project. Drag all remaining regions left to zero. Save the project.
5. Repeat step 4 until all songs are processed.

Good advice, but I would still pause between takes & just say
"OK let me get this set up" and then relocate to like five
seconds forward for a new filename & then say "awright.. check
tuning & nail it!" (or whatever)

Better than having each track on 16 songs become a gazillion-
megabyte file to begin with.

that would work however if you have say 12 songs and have to copy the entire performance 12 times (different projects) you're going to be a very old man by the time it gets done. though after you copy the first one you could just copy the project folders in windows explorer for a small speed improvement. I'll bet copying just one will take over 30 mins.

Hi John,

When you do a save as, you don't have to copy the media with the project. That's a minor detail I left out :-)
