SSC would LOVE this sh*t. Think there are audio applications?

Oh yeah...

Imagine, you sit back in a big chair, the screen descends from the ceiling,
no mouse, no KB.

You bring up a sound, you EQ it with a wave of the hand and squeeze
it with another...

Big time audio applications for this.

DC

Have you seen a price on JazzMutant? I'm thinking Lemur was \$6k+ (but could be wrong), so I'm guessing \$5-10k.

Actually, in place of a control surface (if it fully suffices for one) it could be a viable alternative to an ID or Euphonix MC, though I'm still jonesin' for an MC.... :-)

One day we'll be using these things for mixing and people will wonder what the heck

one did with a hardware console that couldn't change views, layouts, screens, or customize faders, throw length, etc. ;-)

I don't know the prices but they should come down over time.

I'm currently comfortable mixing using a mouse, with no control surface needed. I can be very precise that way, and Logic is already configurable to group and show channels onscreen as I like. So I vacillate on whether a control surface would be a worthwhile improvement.

The MC looks interesting, if you get one I'll have to come check it out.

Multi-touch interface ideas are flashy and intriguing. Maybe even moreso for graphics work than audio. The demos look like fun!

Cheers,
-Jamie

lives. People will start to see that this world of information and entertainment is going to be far more accessible."

I dunno, I've spent a fair bit of my life practicing how to use bash and Emacs. Not sure if I need to be able to push around stuff with my fingers to use a computer.

Also, this is yet another attempt to make a computer act unlike a computer. It's not going to make mistakes, need updates, recognize things incorrectly, and so on. Maybe this is Microsoft's Newton?

I'm a professional geek, I saw the youtube stuff a while ago. Really cool tech, I agree, I just don't see it having a wide enough appeal to go very far.

Same here. Exactly. The geometry required to make this useful is larger than to which I am willing to be "limited" if I may use that word in a lower limit (think mimum speed limit) sorta way.

Seems to me, because of the sophistication of the potential audio application using the thing, that it could provide something to the highend studio that the home DAW people cannot compete with, nor afford.

But the high end places already have things the smaller studios don't, like SSL/Neve desks, big fancy monitors, vintage mics and instruments, hot secretaries, coke dealers on speed dial, and so forth. But they're still getting their clocks cleaned.

I'm wrong a lot, I thought the Colts were nuts for passing on Ryan Leaf (no, really, I did), but I wouldn't bet a dime on the Surface getting traction in the market.

I would. As a security guy, the applications I see for this thing are wild. Casino's have lottsa money and like toys that allow quick and accurate access to visual information. Both visual and proximity information. Imagine one web page to control all entries, cameras, motion detectors and audio groups as well as routing what video to what viewing device. That web tech already exists as an overlay, but with 'this' thing on top of it the possibilities for speed and accuracy go way up.

Will it dominate? Not unless the price gets real reasonable. Consumers are cheap.
