Ok, now we measure the speaker on the desk. Remember, there is rubber feet, then concrete, then a MoPad between the speaker and the desk top, AND we picked up the speaker at one point, completely decoupling it from the desk, with the same results.

This is not a subtle difference. You can clearly see the low-mid boost from the baffle-extension that the desk top represents. It is up to a 9-10db boost...

This is simply not acceptable for any critical mixing environment, and certainly explains some of the struggles I have been having with the mix on this project.

(The sub, btw, is nearly impossible to get flat because of all the chambers and loading that the desk introduces to the listening environment)

The bad news is that for people who still use large mixers, there is little you can do about this except EQ, which is far from a perfect solution. The good news is that for those who mix in the box, there is simply no need for all this furniture. All you need is a computer monitor(s) your C16's and a KB/Mouse between you and your monitor system. A minimalist solution, holding *only* those items and putting the racks somewhere else, will bring a dramatic improvement in monitoring accuracy and the quality/translate-ability of your mixes.

I am going to chat up some of the furniture people and see if such a thing could be designed. It should be cheap to do, and I will also look into having absorbtive materials on the bottom of the units as well.

This has been interesting! Anybody want to buy a KK Audio desk and 2 racks for cheap?

DC

Do it. I smell a product.

Though that takes a lot more than design to succeed....entrepreneurship is a bitch...
