Ok, I put the Paris ASIO driver on my XP machine so that I could use Wavelab 5 with my MEC. Everything works fine UNTIL I close Wavelab and then BOOM .. crash. Not a blue screen crash but the program throws up an error when I close it. It's not a big deal since it's just an extra click on the "ok" button to get past the error. The annoyance is that it must be trying to write the settings to the INI because when I open Wavelab again I have to reset the audio card functions. Anyone else using the ASIO drivers with Wavelab and if so are you having any issues?
