I have been on 64bit windows 8.1 for a good year now. Ok weird stuff, at first it was ROCK solid for quite a while. Then I got some issues when I was doing multiple gain changes, sometimes I got an assertion thing happening, but still worked for hours with no problems. Then lately after booting up, the computer might sit for a couple of minutes and then go into a hibernation type thing restart work for hours. No settings were on sleep or hibernate. Then sometimes I would load first project and Paris would stop responding on first play of project. Close down reopen, go for hours. I just a bunch of the 8,1 updates, twice in two days, reboot, all problems, knock on wood, are gone ! I have been working for days and hours in the last three days, NO problems !! Hope I don't jinx myself. So my point for all this blah blah, is just to let the community know that 8.1 works great! Lots of Rham ! One just has to do the updates. Don't have a clue why it was so solid and then got a little kooky ! but after the updates all is well again. Paris Rocks on 64bit windows 8.1

That's great, Richard.

I'm still on win 7 64 bit. Only issue I have is occasionally Paris fails to fully load and I get a "Paris.exe has stopped responding...", after which a cold boot is needed.

Other than that, during normal use it's solid as a rock, apart from bugs that have always existed in V3.

I wonder if Mike has gotten any further with the version 3.2 he was trying to recompile.

Kim

Oh yes I am familiar with the not responding message. Not since I did the windows updates. I am one of those guys that knows Paris pretty well. and can do what I gotta do. I just don't know why it does it. To me the why does not matter. I am still amazed with the internal combustible engine ! It is kind of funny that excluding a few glitches once in a while, I do many 12,14 hours straight sessions without a problem ! PARIS rocks 8.1 64 bit !

Hi Richard!

I'm still working on the PSCL and the scherzo as part of the ASIO work. I've had the odd crash from the scherzo while opening and closing the ASIO driver over and over. I've been trying to debug it. Let me know if you're up for a newer build. You'll have to self sign it (for now) and put Windows into test mode because my security certificate expired.

Cheers!

Mike
