I read in the MIX Insider Audio feature that a recent study published by the AES shows people can't hear the difference between hi def (SACD or DVD-A) or cd quality (44.1x16) audio. The test group included men, women, audiophiles and audio professionals. They used a variety of high end equipment and a variety of program material including audiophile material from Chesky, Telarc, etc.

A precis of the study is available at
<http://www.aes.org/e-lib/browse.cfm?elib=14195>
