Hi all

I've been playing with Sawstudiolite and no matter how a configure things I can't achieve accurate sync with Paris when tracks are loaded into Saw...

A straight flying tracks there and back via lightpitp results in 2055 samples of latency everytime, but record or drop a track into it and it wanders all over the place. Bob the developer seems to think this is a result of the MTC sync my Dakota card is generating from the ADAT sync in Paris now I know Nuendo and Cubase lock to Paris

So my question is...what other apps do the same

Thanks

Have you tried putting a SMPTE stripe in to read the playback time code?

Hey Aaron

I'll be attempting this today, hopefully with better results

SMPTE was a no go...sending smpte to dakota results in it converting it to
MTC which is what Sawstudio is having problems reading and I have no other
way of reading smpte on my second rig although all ideas are welcome

Go the other direction. Put the stripe in SAW and let Paris chase?

would need a tutorial to pull that one off...and don't you need a smpte reader/interface to do this?

Ebay a JL Cooper PPS-1 or PPS-2. I loved mine, though I haven't had to use them in years they always just handled the sitch with grace. Bet they're cheap now.
