I just loaded Belkin drivers for a USB 2.0 controller on my office machine.
I'm typing this from my backup machine because I'm reinstalling Windows on
my normal machine right now.

ME or XP ? I'm experimenting with Cubase on XP, and just loaded Paris to see
what happened - it's totally rocking.

Belkin will probably **** up either one. My particular one was ME. I am
posting from the ****ee office machine that now has had Windows reinstalled.

I'm going to take that belkin crap back tomorrow and cram it down
someone's.....oh wait.....it *is* tommrrow.....!!!!

^^%*&(^%!!!!

this hasn't been my week for computers

Why should loading a driver completely hose an operating system and waste your valuable time like that?

IOW, why do you hate Belkin yet not even mention the elephant in the room, the operating system manufacturer, when this kind of unnecessary calamity happens to you?

Just curious. BTW, I've also been through the preposterous and silly "reinstalling MSWindows" time soak. I've never had to "reinstall" Atari's TOS, AmigaOS, MacOS9, BeOS, Linux or MacOSX.

Cheers,
-Jamie

My wireless went out last week and hosed XP. UN FREAKING BELIEVABLE.
Last Known config didn't work, Wouldn't boot past loading personal settings.

nice.

While I agree with you completely about M\$oft you know it's perfectly reasonable for a driver to cause a kernel panic and almost every OS out there. As a OS X.CuteFurryAminal user you're working with a mach kernel which makes that far, far less likely (at a performance cost of course) to blow out the kernel but a driver can still make the user space unusable.

In either case if someone doesn't know how to remove the driver and undo the changes made to config files and/or the registry one might wind up reinstalling the OS. I haven't reinstalled XP other than by choice in many, many years, but I'm willing to fish out the .inf file and work my way backwards while booted off of a CD. And the Win32::Registry::File perl module lets me load the entire registry into a hash so searching the entire registry takes, oh, a few hundredths of a second.

Also, you must be a hell of a lot smarter than I am because when I was learning Debian I probably reinstalled fifty times on various machines while learning monkey stupid stuff like what's in /etc/init.d and xorg.conf. Same for BeOS beta on a Power Computing PPC clone when I had to boot into open firmware (OMG I can't believe I remember that, anyone who says your memory is destroyed by alcohol and drug abuse is full of it). But hey, that's just me, other people I guess can get that stuff right on the first try.

None of which in any way is a defense of M\$oft, I promise.

Unless of course you have a bad USB bus (not just driver) on the motherboard that looks like an OSX problem for the first two years - leading to wiping your system drive, reinstalling the OS 3 times, losing 1 hard drive due to corruption from kernel panics (the original system drive from Apple, btw), and find that even for a 4 year old Mac the motherboard is \$700 to replace. In addition, losing CD writing capability due to a faulty combo drive....

At that point you see how relatively cost effective a less than perfect Windows based system really is. Windows isn't great, but at least I can build a complete PC for the cost of replacing a Mac motherboard... FWIW, I've never had to reinstall Windows on any PC I've owned.

;-)

Truthfully, OSX and Windows aren't the solution for audio. There really isn't one. While Linux may be a better OS from a developer's point of view, it just isn't practical for audio since we are so entrenched in the other two now, and it won't be. BeOS was likely the last potential way out of this sibling rivalry between Steve and Bill. Now we won't see an exit strategy until they both companies retire from the marketplace.

Did you guys see that Apple shipped a bunch of video iPods with a Windows virus on board? Joswiak blamed Microsoft for having a virus prone OS. LOL. I'm sure it was MS's fault for making Apple manufacture the iPods to begin with. ;-) These two companies take the cake. Sigh....

Can't live with 'em, can't reformat 'em.

Dedric

Heh. Well I haven't started up my MSWindows box in a while, so I guess I
am smarter than you... ;^)

And I try not to waste time with odd and wobbly concepts like "the registry."

Having to stop everything and reinstall an OS is about the biggest performance hit you can take, so I'll stick with your "CuteFurryAminal" for now. In the future, reliability will continue to be important to me

in OS choices. BTW, "Aminal" is cute just by itself. :^)

I think you're much, much deeper into Linux than me or most folks around here. I'm sure you are way smarter than me when it comes to Linux. I evaluated it enough to know it wasn't quite there for me on a few levels but worth looking at again, down the road.

My BeOS experience has been very straightforward, no "reinstalling" necessary. The only problem there was MSWindows not playing nice sharing the hardware. And of course, the company going under due to non-competitive behavior from DJ's nemesis.

I've never had to reinstall TOS, AmigaOS, OS9 or OSX either, and I'm not really all that lucky. But I've lost a fair amount of time to MSWindows, I'd like to send them a bill.

Cheers,
-Jamie

It's a wonderful feeling to follow the driver installation instructions to the letter, then Install the PCI card, log in to windows and get a little message saying "Explorer.exe not recognized. You need to reinstall Windows"so you boot to safe mode and the same thing happens, so you yank the card and boot to safe mode and the same thing happens.....and you know that your last Ghosting was a week ago so if you just go back to the last image, you lose a weeks work

I'm just now waking up and I actually dreamed about this (from 4:00to 10:30 AM) so it's like I didn't sleep at all.

Good grief, Jamie. You've been around PC's for a while, right? I've seen it 29,463,876 plus or minus a few times. If an elephant was behaving normally and is behaving normally and a mouse makes a booty call and the elephant gets coded ouyt the door into the rain, there' a more likely-than-not presumption leveraged by good ol' horse sense (or elephant sense in this case) that since everything was fine until the mouse showed up, the mouse needs to go bye-bye. While it's plausible that MS didn't give Belkin a full meal code deal for their driver development, mice have been around for a long time and anyone doing device drivers can get it right way easier than getting it wrong.

I'll bet good money you don't let your kids whip out a cereal box CDROM and install cheap apps on your PARIS rig. And I'll bet there are a scant few who sell more cheaply made hdwr/swr products than Belkin.

I've been around computers for a while, yep. If the OS needs to be
reinstalled 29,463,876 times, by at least the 3rd time I would be
questioning the whole system and looking for something more reliable.

If I hitch a trailer to my truck I don't want to see the truck blow up.
If that happened I would investigate the trailer AND the truck. And the
hitch.

I feel for Deej.

BTW, my current music production rig, dual G5 OSX Logic, is always
multitasking a bunch of apps. It isn't "stripped down" at all, plus
there's a ton of stuff hanging off of the various ports. Not that I'm
saying it's perfect, mind you, just that right now it's the most
reliable and capable production system I've had to date.

(Knock on silicon)

Cheers,
-Jamie
